I don't have a clue what people are doing, and what is happening to them, as they are captured, tortured, and caused miserable sufferings, in many places. There must be horrible agony for many people, at this moment, and as each moment passes.

Our reality as it was has suddenly been shattered and torn up, and replaced with the lunacidal, Lesbianistic, mayhem and chaos.

Reuters reports a Lesbianists' joke for the Lesbianists, sarcastically and ironicly stateing, "New Perils Push Doomsday Clock Closer to Midnight" "(Reuters) Scientists have advanced the clock 2 minutes closer to midnight."

http://us.rd.yahoo.com/my/today/new_perils_push_doomsday_clock_closer_to_midnight;_ylt=AmUXlewr5ev2kNK_SfOHDFAL1vAI/*http://news.yahoo.com/s/nm/20070117/us_nm/doomsday_clock_dc_4

This is their private joke, to make this scenario more laugable than before for them. They could not care less, as they are manipulating every thing, and that statement is completely meaningless to them, as they are in control of every thing, in their conspiritorial lunacy to rule human beings, and to trash every one.

We'll see what the coming days, weeks, months, and years bring, and maybe there will be hope for change, when people begin to take action, to correct this situation, globally, united in spirit, permanently.

These are the most evil of evil people and abominant kids, in our immediate vicinity in our universe. We must begin our cleanup campaign here, as it begins where I am, and will continue from here on out, till we have rid my universe of all of these horrible people, and all others like them, and have made them surrender, or have sent them on to my Epcot Center.

I will establish my relgion in my universe, and begin my ministry, and they are not going to stop me, as my religion will bring positive change for all of us, forever.

I must establish myself outside the bounds of this Lesbianistic society, so your efforts and concern for our future, and your selfless giving of donations to my ministry, to allow me to set up my ministry, outside the bounds of this Lesbianistic society, non-dependent on Welfare, Supplemental Security Income or SSI, Medicaid, and non-reliant on the supported and financed Housing and Urban Developement or HUD subsidized apartment that I live in.

Once I receive in the mail, the 'Gift' donations to set up my ministry outside the bounds of this society, I believe things will gradually begin to positively change for us all, and the shift to positivity will begin, and a new universe for us all, will become for the first time, ever, a potential reality with the sincere religious practice by all of my followers, all of you, who are practicing my religion, diligently, and daily, or as much as your health and your time permits.

There in, with your efforts to practice, will bloom your flowers of dignity and hope, justice and freedom, willingness for sharing, cooperating, and participating with others in our new age of enlightenment, the Gurkian Age, and your new found respect for self and others.

Captain Off The Bridge.

It Is Now Time To Kill All Government Workers, Public Workers, Preachers, Islamic Clerics, Christian Bible Teachers, Bible Thumpers, And All Other Persons Who Support The Lesbianists And Their Lesbianistic Societies Around The World - 'Fivers' To Kill Lesbianists And All The Lesbianists' Supporters - Coma Patients - All Persons Who You Kill Will Transel To My Epcot Center - Japanese And List Keeping - Surrendering And Pledging To Serve All People In My Universe - What Does This Mean? Updated: 21-01-07 Rev.d.01.a 19:56 PST

It is now time to kill all police of every police department in every country in the world. It is now time to kill all jail and prison workers in every country in the world. It is now time to kill all zoo keepers who work in zoos and other related places around the world. It is also time to kill all pet store personel, and pet store owners. We do not need people housing and feeding potentially dangerous animals. You are further ordered to kill all pets in all pet stores, and elsewhere, even in private homes. You may then eat them, after you have cleaned out their guts and removed tummy foods and rectal feces, etc., that are decaying matter, that is harmful to your health, and after you have prepared them for eating by cooking, grilling, fire

place cooking, barbecuing, smoke house fermenting, or by other safe and sanitary, healthful cooking methods.

It is also time to kill every fire department official or worker, no matter what capacity the person works in, as a fire truck driver, as an ambulance driver, as an assistant driver, as an attendant or support crew person, as a maintenance man of the fire or the police departement, it is now time to kill them all.

Further, it is time to kill all public bus drivers, who work on any metropolitan or local area or state or interstate, or national bus company. It is time to kill all ships' captains and their crew members. It is time to kill all railroad rail line workers. It is time to kill all subway drivers and subway line workers, no matter what their job is.

Further, it is now time to kill all military personel, SWAT team personel, all government personel, and all civilian, or trained military, national guard, state or federal militia, toy soldiers, the people who dress up in old time war regalia, and outfits pretending they are old time, earlier period, confederate soldiers, or old time earlier period, union soldiers, who act out old time North the 'Union' vs. South the 'Confederates' and who participate in city and town parades, across the United States.

It is now time to kill all retired military personel who support the deranged, crazed, insepient, and corrupted Lesbianistic societies we live in, around the world. It is also now time to kill all persons who in any way support the governments of the world, including but not limited to, all school, university, kindergarden, missionary, day care center workers, nursery school teachers, teachers aids or teachers assistants, United Nations workers, United Nations teachers, substitute teachers, catholic school teachers, Irish protestant school teachers, parochial school teachers, all religious denominations around the world school teachers and their school support workers, government funded school teachers, tuition assistance by the government school teachers, all personel who work for the United Nations, all civil service agents, all DEA agents, all FBI agents, all FDA agents, all EPA agents, and workers, BLM agents who are Lesbianists as well as those BLM agents' who are Lesbianists as well as those friends of theirs, who support the Lesbianists.

It is also time to kill all other federal, state, or local, or globally tasked organizations, such as the CIA workers, INTERPOL workers, the several groups of workers within the Canadian Mounties, NIC a spy department of the U.S. Navy, the Korean C.I.A., the United States Presidential Police agents the Secret Service Agents, National Park Rangers, State Park Rangers, Forestry Service workers, Pentagon workers, National Library Of Congress workers, and all others who work in any capacity supporting any government organization, those listed above, and all others, as well as all persons who support the Lesbianists in any way at all.

It is now time to kill all judges, bailiffs, Supreme Court Justices, and the employees who work in their organizations, and all other judges, legal clerks, para legal workers, court stenographers, justices of the peace, lawyers, attorneys, state attornys, prosecuting attornys, defense attornys. It is time to kill all officials of all government organizations, and all the people who work for them and or even only support them, such as restaraunt workers who feed them lunch, coffee shop workers and owners who feed them coffee and food, bars and restaraunt personel and owners of bars and restaraunts who support and feed any and all persons connected to the governments of the world and who work for them in any capacity at all.

It is also time to kill all the money lenders who loan money to the Lesbianists, the mortgage company owners who provide the Lesbianists with house purchasing loans, and all the supermarket workers and supermarket owners, who supply food to the Lesbianists, as well as all of the druggists, the pharmacy workers, who supply medicines to the Lesbianists. It is time to kill all the taxi cab drivers who give rides to the Lesbianists, and to every person who supports the Lesbianists in any way, at all, unless those people surrender to my kids.

It is also now time to kill all civilian or civil servant or state civil servant worker who supports in any way, any Lesbianistic organization, such as the police departments, federal agencies, fire departments, libraries, schools, and so forth. It is also now time to kill all persons who maintain or provide services to any of the above listed organizations, and to all of the similar organizations in every country in the world.

This is my order to all of you, and you are all ordered, by me, GOd/ GOD, to kill all of them, unless they surrender. People also call me, 'Allah'. I'm the same person. Just do as I tell you.

You are to take my fuels' bombs with chlorine plastics' explosives formulas, and all other explosives formulas I've explained about on my bulletin board and the fuels' bombs explosives formulas including but not limited to radiological 'fracturable' rocks that provide so-called 'nuclear' explosions, all of my bombs' formulas, and all other bombs' formulas derived in part or in whole from what we have learned as I've explained on my bulletin board and to take them, and make the bombs and explosives, and to then use them, and then destroy and kill all of the Lesbianists, and all of the Lesbianists military bases, buildings, and kill every last one of them, all of them, leaving no one alive.

'Fivers' To Kill Lesbianists And All The Lesbianists' Supporters

You are to then make certain they are all dead. If they are not dead, you are to kill them with a 'fiver'. A 'fiver' is a bullet with five lines drawn or scored with a knife or sharp instrument into the tip of the bullet, to form a 'five' line pattern, so that the bullet will fracture into 'five' parts.

You are to take three 'fivers' and shoot each person who has not stopped breathing, and who is not dead yet, and shoot the three fivers into the head of the person, to make certain the person dies.

Three 'fiver's will destroy enough brain material, to kill any person if the bullet is large enough, and the handgun, rifle, or weapon is powerful enough.

The handgun bullet size must be at least larger than a .22 calibur, and at a minimum, 7 millimeters. You may use .38 calibur, 9 millimeter, 10 millimeter, .45 calibur, or any other, large sized bullet to make certain they are dead. Buckshot, 8 guage to 10 guage, or any comparable rifle load or handgun load, or home made weapon load, will work equally as well, with three shots into the skull. A machete or similar instrument should then be used to chop the head off of the person at the neck line. If you have a machete or hatchet, or axe, and if you prefer to chop off the head of the person, then by all means, you are to do so. The point here is to kill the person one hundred (100) percent, and not leave the person in a coma.

Coma Patients

A person in a coma is perfectly alive, and can hear every word you are saying, but can not respond. People in a coma after severe accidents, such as near fatal traffic accidents, where their limbs were broken into pieces, or war victims, who are on life support in Veterans' Hospitals, can be in agonizing pain, and no pain medications are given to the patient as the patient has no way of communicating with the doctors, nurses, or staff members to complain about the pain, in many or in most cases, if not nearly all cases. Some patients can write or scribble out a note about the severe pains, or make gestures with their hands, pointing at painful spots they are able to point to, and then making squeezing motions, to indicate as best as they can, that there is something wrong in the area. Some people may catch the meaning of the gestures, but others do not, and may just wonder what is going on with the patient and they may wonder what the patient means by the hand gestures. Others, doctors and nurses, and staff members will merely find it amusing that the patient is making the gestures. Some doctors and nurses, and possibly staff members, will figure out the patient is in pain, and then steps can be taken to alleviate the pain, but it is an ordeal for the patient, and it may take months, or in some cases, years, before staff, cleaning persons, food servers, orderlies or assistants, nurses, or doctors figure out what the hand gestures mean.

The coma patient, after healing from the injuries, may still have residual pains, such as residual spinal pains, or neck pains, or ligament pains where ligaments were twisted, or ruptured, or severed, partially or wholly, and the ligaments didn't grow back properly, or didn't grow back fully, or much, or perhaps, in some cases, not at all, which does happen a lot, and each time the patient is moved in her or his bed, the person experiences extreme pain as no medications for pain are given to the coma patient, unless the patient has been

successful in communicating that there is pain felt by her or him, in her or his body.

Leaving coma patients on life support systems is the cruelest thing you can do to a person in a coma as there is no such thing as being 'brain dead'.

It is a cruel and abominable Lesbianists' joke on humanity, and on all persons, that the Lesbianists have perpetrated with their teaching doctors and nurses that coma patients are brain dead, and do not feel, hear, taste, or sense, anything at all, and it is just another one of the Lesbianists' ways to hurt and torture people, and cruelly and ruthlessly abuse human beings, in this case, in most of these cases, by proxy. There are doctors who are Lesbianists, and I have one who is one, that I am aware of, and he knows exactly what causes my health problems, but he sits there, non-responsive, and with a vacant stare on his face as if he doesn't hear, see, or know of any thing that is going on, something like the three monkeys with hands clasped over their, ears, eyes, and mouth, who represent 'hear no evil, see no evil, speak no evil' and then 'therefore, every thing is alright'.

All persons with brains, whether in a coma, or other sleep like state or condition, is perfectly brain alive as the brains and nervous systems, auditory, taste, touch and sense nerve systems, never die, until the patient stops breathing, and passes on.

All nurses and doctors are to remove all life support systems from all persons in a coma, immediately and confirm the persons have died. That will allow them to transel into my Epcot Center, and then be born again, as a tummy baby to a tummy mommy and to tummy daddies.

All persons in a coma, whether in a hospital, or in a nursing home, or at a private home or apartment, or in a group home, or group care center, are to be told the truth of this, and are to be told that you just leared it, and are to be told that I am GOD, and that I have an Epcot Center staff waiting for them to come in, to be treated for their traumatic condition, of not being able to do any thing about their condition to end it, as it is a miserable situation for these people who are in a coma, or in any trance like state or condition that resembles a coma, or a sleeping person, who can not wake up. The person is perfectly brain active, and there are no measuring devices to prove it available to hospital staff or to doctors, as none are made, and the technologies to detect a person's brain activeness and aliveness are kept secret after they are bought up, and then after the records of them are destroyed, and the information on them are kept secret and locked away, in vaults, and in storage facilities, hidden from view so that no one can get the information, and build a device to detect a person's brain alertness status.

After they are told the truth, and that you just became aware of it, you are to tell them to not be afraid, and that all measures to relieve them from their present condition, and all measures to assist

them to transel to my Epcot Center, where they can recieve personal care, and then helped to recover from the trauma of the coma, or coma like state of not being able to wake up, speak, and talk to people. They are then to be injected with a powerful sleep sedaditive, or induced to swallow several strong sleeping pills, as they may become afraid, and then, you are to help them to pass on, and to transel over to my Epcot Center.

In some cases, if you pull on the large toe of a person, or on the thumb, the person may have control to pull in the opposite direction. That is an indication that they are awake, and fully aware of what is going on around them. Please check patients to see that they have soundly fallen asleep, and snoring or breathing quietly, in relaxed manner, may be the only sign that the person is asleep.

Any sign of movement, mentally driven by the patient, no matter how slight, is nearly most always, nearly one hundred percent of the time, a sign that the person is completely brain alive, and that the person is completely aware of what is going on around her or him and can hear every thing. Even passing or expelling gas or farting, can be 'mentally' driven, and a sign the person is awake, and alert, and brain alive. Opening one's mouth is almost always, one hundred percent of the time, mentally driven.

Persons's in a coma, who have Eplilepsy, or other similar brain or neuro muscular disorder, and other conditions where patients experience spasming, whether the condition is diagnosed or not, these patients who spasm, may make some spamodic movement, now and then, and that is only a sign that the person is haveing a neuro muscular muscle spasm. Knee jerks or other similar movements, are not always muscle spasms and can be labored, mentally driven actions. These actions show the patient has control to that extent over her or his muscles, body, skeletal system, and other body systems related to the movement.

In any case, after the patient has fallen asleep, you are then to kill the person, and let the person transel to my Epcot Center, so that the person can recover in my Epcot Center, and then be born as a tummy baby, to a tummy mommy, and to tummy daddies.

All Persons Who You Kill Will Transel To My Epcot Center

Once you are certain all of the police, fire, teachers, and all others who support the Lesbianists' societies around the world are dead, they will transel to my Epcot Center.

It is now the time to bring an end to the lives of these people who support the crazed, insepient, bogus Lesbianists, and to destroy them all, leaving no survivors. Kill all of their family and relatives, and leave no one alive. Kill them all.

My Epcot Center will not be in any way, inconveinced by your brave and heroic actions. All doctors must be killed, all nurses must be killed. All medical techinicians must be killed. All library workers must be

killed. All school teachers must be killed. All art museum and gallery museum workers must be killed. All workers for all of these institutions must be killed. All of them, in every country of the world, unless they surrender and plead for mercy, and then are allowed in to my kids' place, for swearing in and for joining as civilians, my country.

Further, it is time to kill all media corporations personel, such as news casters, news men, news women, anchor persons, cameral men and women, talk show hosts, administrative persons, Hollywood's movie actors and actoresses, all radio broadcasters, and all personel of all radio companies. It is time to kill all news paper company owners, and publishers, editors, and all workers of these companies, unless they surrender to my children and plead for mercy.

It is time for all of you to kill all of them, and make sure not one of them is left living, including and most importantly, all politicians, who must all be killed, without any further delay. It is time to kill them all.

It is now time to kill Oprah Winfrey, Geraldo Rivera, Sarah Jessica Parker, Judge Judy, Jerry Springer, Liz Taylor, Michael Jackson, Clint Eastwood, Cher Bonno, Morgan Freeman, Steven Spielberg, Al Gore and his family, Hillary Clinton and her family, all of them, Jeb Bush and his family, all of them, Nancy Reagan and her family, all of them, former president of the United States President George Bush, Sr. and his family, all of them, including all persons related to him in any way, and all persons who work for him, in any way, and all persons who work for any of his associates, in any way, unless they surrender to my kids, and then plead for mercy.

We are not going to allow the Lesbianists to continue their illegal, inhumane, and horriblesome practices and activities on my planet, and in my universe, a moment longer. They must all die, now.

Is that understood?

I hope the answer is, "YES SIR! Mr. John Francis Ayres, GOd", as a 'negative' reply to my question is not acceptable.

Japanese And List Keeping

I haven't confirmed it, but from what I know, so far, the Japanese are very good at keeping lists, and they know about all the foreign people in Japan, and they keep lists of names of all of them, and they keep lists of names on all of the Korean people, and the Singaporean people, the Chinese people, the Ainu people, and the cast outs or 'burakumin' a group of meat cutters and fish sellers who some how got on a list of people who were felt to be 'unclean'. The 'burakumin' was a group of people who no one in Japan wished to talk about. The Japanese also, apparently, had lists on groups of people, who they didn't know much about, but they knew they were always doing things with each other. Those groups of people were the Lesbianists, so the

Japanese knew all along, who I was talking about and were nearly one hundred percent certain those groups were the Lesbianists living in Japan.

They read what I wrote, and the notes of mine were passed to many people on an e-mail mailing list, and when they heard that Steve Irwin had been killed, they felt they had heard enough and they told all their friends about my notes, and then the Japanese killed all the Lesbianists in Japan on that list they kept.

It's something I heard, and I haven't confirmed it, but I think the Japanese are fully capable of handling that, as they were fully prepared to deal with each one of the Lesbianists, and they knew who they were, and once the Japanese united, and decided to take action. The Japanese escorted all the Lesbianists to a meeting place, to which the Lesbianists were not happy to go to, but had no choice but to agree to follow the Japanese citizens who escorted them there, with the military or Japanese Self Defense Force, the Coast Guard, and National Police, and all other police agencies in Japan, plus the national organization of fire department workers, backing and supporting all the Japanese citizens.

As to what they did with the bodies of the Lesbianists, I'll leave that to them to explain to you, as it was quite brilliant and they had many very good ideas for dealing with the bodies of the deceased Lesbianists, who are apparently now in my Epcot Center.

The Japanese country side is now peaceful and quite, and things the winds are blowing, peacefully, and gracefully over the Japanese country side, cities and towns, across the ponds, marshes, lillies and lotus flowers swamp lands, bogs, bays, estuaries, lakes, streams, rice paddies, fields, mountains, and islands, from what I can understand and gather about the situation in Japan.

Surrendering And Pledging To Serve All People In My Universe

If the Lesbianists and their supporters surrender to my children, and then promise to devote their lives for the sake of others, serving man kind, and all human beings, and all people on this planet, and in my universe, for the rest of their lives, they will be allowed to surrender to my children, and my children will then arrest them and put them in a prison cell. If they are not willing to serve others, despite the fact that they say they will serve others and devote their lives for the sake of others, serving all people in my universe, then my children will ignore them, and my children will not arrest them because my children know they are lying. They must promise to do all they can that is humanely possible, for the sake of others, and devote themselves to the prosperity of others, for eternity. If they are not willing to do that, then please, just send them on to my Epcot Center, and we'll straighten them out, for there. My staff at the Epcot Center has training programs to straighten them out and make them nicer people, so that next time they are born as tummy babies, they will

behave and be nice to others, doing nice things for other people, after they are retrained, a little. The retraining program takes a while, but the results are very good to excellent.

If my kids decide that the person who is surrendering, is telling the truth, my kids will use the special teletransportation technology, something like what we see in Star Trek on tv, with Captain Kirk saying, 'Beam me up, Scotty!', as many of us have seen on daytime tv, or in the movie theater, and my kids have very good teletranportation technology or 'beam me up, Scotty' technology, and the person, once he or she pledges honestly to serve others, will instantly dissappear.

Do not be surprised if when the person surrenders and promises to 'serve others', promising to devote her or his life for the sake of others, the person suddenly dissappears, and instantly, the person is no where to be seen. The person was 'beamed' into a prison cell that my kids have constructed, using other technologies, and we have many prison cells waiting for the Lesbianists and for the Lesbianists' supporters, and for other bad kids in my universe, as well.

For each person you kill, my kids will keep earning points scores on your efforts to send them to my Epcot Center, and you will be paid, when you have finished your job, and then finally, go in to visit my kids. My kids will pay you in the monetary currency that is used in the underground cities my kids have built, for protecting people from these horrible Lesbianists and for protecting people from the abominant kids of mine, and the ghastly and naughty animals and very large bugs and spider like creatures, that the Lesbianists use to help them torture people with, to make the Lesbianists laugh, and to amuse themselves, as I've explained a little about, already. The more Lesbianists and Lesbianists' supporters you send to my Epcot Center, the more earning points you will score, and the more money you will earn, and you will be paid that money, when you go to visit my kids after you have finished your work, killing the Lesbiansts and the Lesbianists' supporters.

If the Lesbianists and the Lesbianists' supporters do not disappear after they surrender, and after they promise to serve others, and pledge to devote their lives for the sake of others, the Lesbianists and the Lesbianists' supporters are lying, and you can then kill them, and send them on to my Epcot Center.

My children will escort the deceased Lesbianists and Lesbianists supporters, once you kill them, into one or an other of my Epcot Centers, and will make sure that the Lesbianists and the Lesbianists' supporters get in for a meeting with one or another of my managers, or with one of the staff members who work with my managers to arrange retraining programs for rehabilitating the Lesbianists and the Lesbianists' supporters.

The Lesbianists and Lesbianists' supporters will not qualify as tummy babies, until they are finished their retraining and rehabilitating

programs. After they finish, they will be out, again, to join the rest of you, once again, but this time, as nice, kind, courteous, and polite people.

What Does This Mean?

It means, I want all the Lesbianists dead, but if they will surrender, and if they promise to serve all human kind, all people, and work and strive to enrich the lives of all others, dedicating their lives to others, then, you do not have to kill them, and you do not have to send them to my Epcot Center. If they are honest when they surrender, and when they promise to serve all people, devoting their lives to all people of the world, then my kids will 'beam' them in, using the teletransportation technologies that my children use. If they are lying, then my children will not beam them in, and they will be stuck where they are. If they are stuck where they are, after they surrender to my kids, and after they promise to dedicate their lives to the welfare of all others in the world, and to all others in my universe, then they were lying, and you may then kill them, and send them on their way to my Epcot Center, for retraining, and for rehabilitation.

It also means to kill any person who works for the Lesbianists, if he or she is supporting the Lesbianists to try to stop you from killing the Lesbianists. Also, it means that you should kill any person who tries to interfere with you, while you are trying to kill the Lesbianists.That's what it means.

Captain Off The Bridge.

Fermenting Oils - Fracuses Kiddies - Slugs, Snails, And Other Bottom Feeders - Feeding Everybody In Our Bodies - Putting An End To The Global Menace Of The Lesbianists - Changing Our Societies, And Our Universe, Forever Updated: 22-01-07 Rev.x.00.a 07:45 PST

Mix raw sugar, ocean salt, sessame seeds, dried fermented berries you have taken from a mix of berries fermenting as a flural hydrate liqour, or as a plain fermenting liqour, and make sure you dry them out in the oven, before useing them.

Mix the items together in a container, and mix in a drop or two of apple juice, pear juice, papaya juice, kiwi juice, banana juice, cherry juice, cranberry juice, strawberry juice, peach juice, nectarine juice, or plumb juice, and let the moisture settle into the mixture to allow it to become only partially and only very slightly moiste, and not wet or liquidy.

Allow the mixture to sit in a warm or cool place for a week or two, to eight to fifteen weeks, or even a few years, and it will grow molds in it, and with the longer the duration up to a point of sitting and

molding, the more useful it will become.

It might develop a pungent, unpleasant odor, like a dead animal smells, which may mean that a fungus that is not very suited for you to use as a starter mold for starting a fermented oil batch has developed in the container, and in that case, you can throw the whole mix out, or use it for fermenting beans or something. Cheeses can be made with these kinds of growing funguses and molds, if you are the daring type, who likes to experiment with new and different tastes from variously fermented mixtures.

You can add some ocean salt, and make a soury vinegar, and then try to rescue it with the combination of the soury vinegar, ocean salt, and a little raw sugar, and some honey.

It may be that some bacteria is in the mix, and it needs to be eaten up, before you can use it safely for a healthy mold mix for starting a nice cheese molds and funguses mixture.

Ocean salt can be added in slightly large amounts with raw sugar. Once the odors have stabilized, and once they have developed a more pleasanty odor of a fermenting mixture, with a slight alchohol ferment odor that will indicate that it is alright to use, and that it will not be harmful to you.

In some cases, the bacteria in the base mix, may be a result of hairs or particles of skin from the body of a dead rat or mouse, that some how found his or her way into the sessame seeds, or into the dried spices, or into dried berries that you used, and then died.

In that case, you might as well throw it away, unless you have a lot of patience, and do not mind waiting and working with it, for several years, for it to become something you can use.

One way to make it into something you can use is to mix in a high potency liqour brew, and let it sit for a number or years, and ferment it, and then after it smells nice and rosy smelling, after ten to fifteen years, to thirty to fifty years, you can evaporate the liquids out in a pail on an open porch that has a net covering to keep animals and animals' hairs out of it. Make sure there is good ventilation, and it should evaporate out, safely after a number of days on the porch in the sun. If there is no heat to make it hot enough to combust, and if there is good ventilation, it will not combust, and it will evaporate out, safely. Adding ocean salt and raw sugar to the mixture so as to fill it up with raw sugar and acidic ocean salts, will further help to safely evaporate out the liquids and prevent the liquids from combusting, accidentally.

Once the liquids have evaporated out, safely, you can use the materials that remain in the pail or container, to start a fermented oils brew mixture, or to start a cheese molds and funguses mixture, if you wish to make a nice cheese molds and funguses mixture.

The particles of skin or hair from the dead rat or mouse, or pidgeon, or other animal, will have been eaten up by all the ferment fracuses kiddies, and will no longer pose a threat to your health.

Fracuses Kiddies

Ferment fracuses kiddies are just plain old ferment kiddies who like to devour large bits of human or animal tissues, mites, or cockroaches, or their body parts, and then poop them out, and pee them out into the liqour brew.

You'll always have some of these kiddies in your brew mixes, and they are useful to you, as they eat up the things that you do not want in your tummy. Also, there are other kiddies, such as snails, and other bottom feeders, that find their way in, in the skins and pulp material as tiny animals, or the eggs of animals, and they hatch, and they develop, and they grow big, and they then bottom feed, and they eat any dead rats, and dead rat parts from rats that might have fallen into the brew. These are useful pets, that you want in your rum and liqour brews, as they will keep the liqour brew healthy to drink, and they will keep you from getting ill.

Slugs, Snails, And Other Bottom Feeders

In the old days of bucanneering, as I may have mentioned, before, this was a crucial part of keeping the sailors alive, on their long voyages, and if crew members fell ill due to an unhealthy brew, with a dead rat in the mix, making it sour, and making it unhealthy to drink, then if there are not enough snails, slugs, and bottom feeders in the barrel or rum to eat the dead rat parts, the sailors will get ill, and when they get back to port, they will hang the rummery owner, and give the business over to the son, or to a third party, often times, one of their fellow crew members, who is liked by all the people, locally, and on the ship.

This is the case, still today, with many rummeries owned and handed down in the same family, from such instances as that.

Bottom feeders, slugs, snails, and many types of bottom feeding earth worms, and other types of healthy bottom feeding worms, that cohabitate well with the slugs, and snails, and other animals that are too tiny for you to see in the rum brew mixture, without a powerful microscope like, optical videoing technology, are essential to your brews mixtures, and they may increase in numbers as they make babies like every animal and living being does, and so now and then, you need to reach into your brew container, with your hand, or with a fine mesh small aquarium use fish net, and scoop them out, and flush them down the toilet, or let them loose in a local pond, lake, mountain stream, or water springs fresh water well, where they will help to keep the water clean, ahd healthy.

Once you have the materials to make your fermented oils mixture, you can add them to your container of food oils, and begin to ferment them, or use them to make a nice cheese mixture, to ferment and then

to make solid as it matures with age. You can also use the materials to make a fermented bean mixture, or fermented barley, or fermented rice, or fermented millet, or fermented wheat mixture.

You can also use them to make a fermented brew mixture, as there will be many healthy molds and funguses kiddies in and among the dried out materials. Your health will improve, and by adding different spices, nuts, berries, root particles, ground up kiln dried pine cones that were green to begin with, and then fermented for a few months to a few years, in a brew mixture, then dried out, and ground up into a saw dust powder consistency, you can then have lots of crystals cages salts kiddies of various kinds help you to make a nice regroverative brew, to help you to regroverate your amoebes.

Feeding Everybody In Our Bodies

You know, we need to eat foods to stay alive. We also need to feed all the living animals in our body, to help them to stay alive, so that they can help our health remain normal, from day to day. We also need to feed the amoebes all the foods and juices, salts kiddies, and the poopy liquids and pee liquids, and other liquids with other types of tinier salts kiddies in them, as well as other types of food kiddies, we haven't learned about, yet, but with all of them inside your tummy, you'll be able to feed every one who needs feeding, and then you'll be successful with your amoebe 'auto regroverate mode, on!' formula, so long as you have degunked your body of all the petro chemical oils, kerosene, diesel fuels, and other chemicals, the Lesbianists have been feeding you, from birth, in your diets, if you live in a society, where you are fed baby formula mixtures from Gerbers or Heinze, or any of the other baby foods manufacturers.

Putting An End To The Global Menace Of The Lesbianists

We need to put an end to this practice by the Lesbianists of poisoning us with their petro chemical industry oils and tars salts kiddies, which they use to rot our teeth out, and cause tooth decay, and which they use to cause ulcers in people's tummies, and which they use to cause lots of unpleasant illnesses, and diseases in human beings, and in farm animals. These petro chemical salt kiddies, and formaldehyic salts kiddies, all harm our amobes living beings children, and all the other animals that live inside of us. One day, we will have a lot of people practicing my religion, sexaling, and making prayer statements so as to help us to erase the karmic markups we have, that keep us living under the tyranny of these Lesbianists, and in their societies, suffereing the daily poisonings that cut our lives short. When we have erased enough of our karmic markups with my religion's religious practice of sexaling to purify our selfs and others around us, and to clearify and erase our karmic markups, we will eventually be able to say good bye to the Lesbianists, and their practices of poisoning us, and causing us major headaches, or problems in our lives.

Changing Our Societies, And Our Universe, Forever

At that time, we will be able to say hello to a whole new way of life, and that will be the beginning of our new, thrilling, and excitingly challenging, one world, unified, planetary, global culture, and it will be the begining of our new, thrilling, and excitingly challenging, one universe, universal culture for all of the people in our universe, who we have been living in our universe together with, since we first came out, and began living here in my universe, a very long time ago. We have to start somewhere, and so here we are, now, begining to prepare the foundation for our long and prosperous journey ahead of us, as we clean up our universe, together with each other, and clearify and erase all of our karmic markups, and all of the karmic markups of all my children, and of all living beings who live with us, together with us, in my and our universe. We need to take responsibility for this clean up campaign of ours, as we are the only ones, besides my many worker, unionized children, who can use our brains, and use our sexaling organs, to produce purifying energies of all types, to help us clearify and erase all of our karmic markups, and all karmic markups, and karmic things and dings, of all of my animal children, and of all of my living beings children, and of all of my human children.

My kids have built underground cities, to help us to get started, in learning about the new ways of living together, and of sexaling together, for practicing my religion together with each other, so that we will be able to prepare ourselves, for our new global, unified society, and for our new, universal, united, civilization. We have a long ways to go, but we are starting now, with your efforts to correct this situation by eraseing the karmic markups and karmic things and dings, that have us living in this truly awful situation on this planet, in our universe, that we are now, curently living in. One day, when all the Lesbianists are either dead, or have surrendered to my kids, we will be able to gradually educate ourselves, and change our understanding about women and girls, and about men and boys, to understand the truth about women and girls, and about men and boys, and then we will begin our new and exciting journey into our future, together, with my religion at the basis of our new, unified society, universal culture, and universal civilization.

Captain Off The Bridge.

And Children

Donations To GOd - Monastic Mode - Who Works For Me, Anyway? - Obeying Orders - Every Politician In The World To Be Executed - Every Hollywood Actor And Actoress To Be Executed - Jump Ship, Explained - Fair Warning - Particle Remis Technology And Particle Dismiss Technology - Dismend Technology And Remend Technology - Mentalcosis / Mentaltosis And Comatosis - Michael Jackson - Retractions Updated: 26-01-07 Rev.b.02.a 06:45 PST

Donations To GOd

Why can't anyone donate any thing to me? I am GOd. So, how come no one can send me a penny in the mail, or a box of cookies, or a pair of socks, or something? I don't think I'm asking for too much, but I'm just curious about why no one can send me anything in the mail?

I don't get any phone calls. No one sends me any e-mail. No one tries to visit me. I have a religion, and I'm asking people to practice it. Now, how come no one can contact me?

I once said that I am in a monastic mode, and it is a cloistered monastic mode. That means, no one can be contacted out side of my monastery by any one inside the monastery, and no one can contact any one inside the monastery, by any one outside the monastery.

If there is no legitimate monastery business then no person will be allowed to contact me, or for that matter, any one else inside my monastery, who is leading a monastic life, with me.

Well, there is only me, right now, but maybe in the future, some one will be in my cloistered monastic discipline with me, helping me with my religious duties of doing my religious ceremonies, as I've mentioned about, before.

Monastic Mode

What does my 'monastic mode' mean? It means that I am here as GOD. You know, there is only me. I of course never sent any one, such as the Lesbianists claim. Why would I? I don't need any one to do the things I need to do. That's sheer idiocy to think I would have a son or daughter, and send them to do my business. That's absurd. You've been snookered into believeing all those hogwash tales, and now you don't know who I am, and you don't have the karma to believe in me, as a result of your following and believeing all those hogwash tales. My kids are everywhere, and they are doing their jobs.

Who Works For Me, Anyway?

Now, as I've been saying, I'm going to have you do your jobs, and that is to use your genitals, and to use your body, and to use your brains, and then participate in my religion, using your genitals and your body and your brain, and sexalate with each other, and purify your karma? Does that sound like a joke to you? If it does, you are very mistaken because it is not a joke in any way, and I am absolutely serious when I say that you are going to use your 'equipment' and I almost want to call it, your 'field' equipment, because you are armed with it, day and night, and you are going to use that equipment, to clearify and erase your karmic markups, and to purify my universe. Is that okay with you? I hope it sure the hell is, as a "NO SIR!" at this point, would be an unsatisfactory reply. Do you understand me? I hope so. You are going to jump ship, as I order you to, or be thrown over board, if you have a problem with that. I hope you understand.

Well, as far as I can figure it, no one realizes that I am GOD, so no one can donate money to me. If some one realizes that I am GOD, than

for the first time, that person will be allowed to donate money to me. That person will be allowed to visit me, or call me on the phone, or donate money or food to me, or practice my religious ceremonies with me, if that person believes, and understands, and realizes, that I am GOD.

Right now, there is no one who realizes or understands that I am GOD. No one of course believes I am GOD. Never the less, I am GOD, and I am sitting here, waiting for donations, to help my ministry get started.

So, that is the reason that no one can get through to me, or donate money to me, or send me a postcard with some kind of message of cheer and support in it.

There doesn't seem to be any body who believes that I am GOD. Well, that isn't surprising. People do not have the karma to believe that I exist, is one way of looking at it. They have ignored my existence, and have not had any real thoughts about me that would link them to me, in my monastic mode.

What does that mean? It means, that no one remembers me, as the guy who created all of you.

It also means, that I am in a religious mode, and no one understands that, or believes that I am in a religious mode.

That is peculiar, since I am giving you a religion, one of my oldest, for you to practice, that will assist you in purifying your life, and that will assist you in eraseing and clearifying your karmic markups.

That's very peculiar, but it is not that peculiar, as you do not have the karma to realize and understand that I am GOD.

In any case, there will be no donations, no telegrams, and no phone calls or letters to me, so long as you do not realize, understand, and then of course, believe that I am GOD.

Well, any way, so it goes.

Obeying Orders

Now, I want all these people, killed. Hillary Clinton. Bill Clinton. Chelsea Clinton. Ted Kennedy. Al Gore. Tipper Gore. Harriet Gore. Cheryl Gore. Dave Gore. Bill Gore, and all people who call them selfs, Gore and pretend to be related to Al Gore, or to Tipper Gore. Mr. Al Gore has lots of friends, who are also Lesbianists, and I want them all killed. Oliver North. Monica Lewinsky. Eve Arden. Elizabeth Arden. Michael Jackson. George Bush Sr. and all other George Bushes. Do you understand what I mean? It means, that they are all Lesbianists and they are all going to die, and we are going to blow up Washington D.C., and destroy Capital Hill, and level that area, and make it sink beneath the waves of the Atlantic Ocean. That's how big a bomb I want you to make, with my fracturable rocks, to then blow that area out of the water, and make it sink below the waves of the Atlantic Ocean.

You'll probably need more than one bomb.

Did you know that Washington, D.C. is lying on a fault line, deep down, and it is on an ocean shelf, that has the ocean under it, lapping at the earth, very far down. That means, that it is on a fault line, and it is on a shelf, that is hanging over the ocean's waters.

Now, if you hit Baltimore, and Maryland, and Northern Virginia, and Washington DC with a large enough bomb to blow Baltimore out of the ground, and level it, and with another bomb large enough to blow Washington DC out of the ground and level it, at the same time, and a few more bombs, large enough to blow Maryland, Virginia, and that whole metro area out of the earth, at the same time, you will sink the nation's capital, that is, Washington DC, below the ground, as it will break off the ledge that it sits on, and it will sink into the ocean, as the ledge crumbles below it. There will be water, from the Atlantic ocean, all the way out to West Virginia.

Now. I have every right to say that, and demand this, as it is a matter of self defense, as I know these motherfuckers are eating people, cannibalizing my kids, for their amusement, thrills, and fun, and they will continue to do that UNLESS THEY ARE STOPPPED! Do you understand that?

I hope so. I am going to see the whole of Washington DC and the area leveled, with Baltimore, and Northern Virginia, and Maryland, as well, and we are going to sink that area into the ocean, and make it disappear below the surface of the waters of the Atlantic. Now, that should be clear, shouldn't it.

This is not a joke. We will have to send a lot of my children to my Epcot Center, in the blasts that will occur, and in the after math of the blasts, but that is unavoidable.

We will have many people, drowning in the waters that come in from the ocean, and that stretch out to the hills of West Virginia, with only slight outcrops of land, hills, here and there, with a few people lying on top of them, blinded and in awful pain, but they will not live long, as they will not be able to survive for long, and they will pass on, die, and then they will transel to my Epcot Center, where they can get medical relief, medical treatment, therapy counseling, and rehabilitative therapies.

Now, that is what we will do to Washington DC and vicinity, so every one, please prepare for it, and get your pain medication in order, so you can take an over dose of pain pills, when your area is blown and shredded to bits, with one or more of my fracturable rocks bombs, as I've explained about.

Every Politician In The World To Be Executed

Next, I want every politician in the world, canceled out. I want their passports for living on our planet, canceled. That means, I want you

to kill each and every one of them. Not only do I want you to kill them, all, but I want you to kill every single one of their associates, around the world. They are all Lesbianists, except for a few of them. If you happen to kill one of the non Lesbianists policitians by mistake, that is okay. They have the option of surrendering to my children, available to them, and once they surrender, they will not be killed, by accident.

Every Hollywood Actor And Actoress To Be Executed

After that, I want every Hollywood actor or actoress killed, and that includes all the actors and actoresses, around the world, and they must surrender to my kids, if they wish to not get killed. There are a lot of them, who are not Lesbianists, so those I've mentioned, who I've let you know are not Lesbianists, you can forget about them, and leave them alone.

There are more than a couple of billion Lesbianists living under the earth's surface, in underground cities. I did not realize there were so many. We need to kill them all, so we will, in time, unless they surrender.

Is that clear, every body? I hope the answer is, "Yes, Sir!" as you had better not answer any other way, or you will get yourself on my shit list. Is that understood? Good. I am the boss of my universe, so if you do not like it, than jump overboard, now, sailor. Have you got that clear? Good.

Jump Ship, Explained

What does 'jump overboard' mean? It means you are going to have severe problems with me, if you do not obey orders, and that there will be difficulty and jail time, ahead of you, if you continue to ignore my commands to you. It means there is going to be trouble, if you do not obey me. My kids are in charge of handling all the details on that, and it is not a joke.

Fair Warning

We are not going to let these Lesbianists run their show, one more minute. We are going to put an end to them, and their activities, here on this planet, and every where else in my universe, and this is fair warning of that.

Particle Remis Technology And Particle Dismiss Technology

As I said, once before, there is a technology called particle remis technology. There is also a technology called particle dismiss. They are the technologies that you can use to feed 2.3 billion Lesbianists down under the surface of this planet, and on every other planet that they are on.

Dismend Technology And Remend Technology

It is easy to dismiss molecules, and to dismiss, or dismend all the beings who need to be dismended, and sent to my Epcot Centers. It is also easy to remend them, and then get them back into the foods that I need them to be a part of.

My kids keep track of every one who needs to be dismended, and then remended. That is a lot of work, keeping track of every one, but that allows us to dismend the living beings, and animals, that I can let off from duty, and from further service, and then send to my Epcot Centers for them to live in. I can then recall them to duty, and remend them, and then have them serve in an apple or an orange, or banana, or a brick. Do you think that is a joke? It is not a joke, and there is no joking allowed, on my shift. Do you got that? I hope so, because if you do not, you will have to learn how to swim a long ways, as it is going to be a long way from shore, after I ask you to jump over board, and I have sailors who practice, all the time, just to show the passengers how it is done, just in case. I will have you jump from ship, if you do not get along with me, and if you disagree with what I am doing, pretty soon, as we are departing, now, or just about now. That means, we are not going to play around, much longer, and we are going to set sail. That means, there are going to be a lot of people practicing my religion, pretty soon, as they will learn about it, and they will begin practicing it.

Mentalcosis / Mentaltosis And Comatosis

Mentaltosis is the state of a vegetable, like a stalk of cellery, or a plumb, or an orange. Comatosis is the state of complete awareness of self and others. Comatosis is not brain dead, i.e., more or less, mentaltosis, with no real significant brain activities occuring, other than the ones that keep you alive, and vegetative, and you do not need assistance to remain and function in a state of mentaltosis, and the Lesbianists know it. You are severely brainally handicapped, and when you come out of it, eventually, after you have your karma fully completed for being mentaltosically ill, and after it is then time to get on to something else, you will be very brainally handicapped, and you'll be an extremely retarded person, with little to nearly no brain awareness going on about self and others, but able to walk, barely, and later, after many many lifetimes as a mentally retarded individual, you'll begin to be able to mumble a little, or babble a little, for umpteen lifetimes, as you begin to get your higher brain functions, back, which takes a very long time to work out, and many many lifetimes to work out, karmically.

Comatosis is like a hit on the head, and when you wake up, your faculties are not all working, and you may not be able to speak, or move, or talk to your friends, but mentally, you are all there.

Mentaltosis is like a train ran over your brain, and every other nervous system in your body, nearly, and you are completely unable to think, or do any thing else, and you are reduced to a mere pumping heart patient, with not much else going for you, except you are breathing, and technically, you are alive. You can sit there for a

million years, or a million or so life times, before you begin to come out of it, and then reveal your disorder of severe mental disorganization, mental disfunction, and mental retardation. There is a big difference between a bonk on the head, and a train running over it, and the rest of your body. Coma patients are fully aware of what is going on around them, and they may not be able to speak, but they are there, and they can twitch a finger, now and then, or flex a toe, or raise their tummy up a tiny bit, to pass gas, usually, and relieve the bloating sensation they are experiencing in their tummy, and in their intestines, or colon. They may be able to grasp your hand, and fully hold on to it, and not let go, for hours, if they have the strength for it. This horrible torture the Lesbianists are perpetrating on comatosic patients, needs to end, now. Person responsible for continuance of hospital policies, despite our informing them of the truth regarding this, are to be shot and killed, and sent to my Epcot Center, if they interfere with the removal of the life support and life support assitive devices, that are plugged into the comatosic patients mouth, or nose, or other orifice of their body, or any part of their body. If some one refuses to cooperate, you are to throw them out of their hospital unit, and give them a good whack on the head. Come back in a few days, and then disconnnect their life support assisitive pumps, and tubes, and so forth, and shoot them in the brain with three 'fivers', as I've explained about, and then send them on their way to my Epcot Center. That is an order. Now do it.

I want you to pull the plugs on all the GI's and civilians who are on a breathing assistance machine, and life support assistance equipment, and I want you to send them all to my Epcot Center, where they can get treatment, and therapy, and then get themselves ready for being born, again, as a fine and a healthy, tummy baby to a tummy mommy, and to tummy daddies. You had better comply, if you know what is good for you, as my kids are now keeping track of your records on this account, and you are not going to do very well, if you do not follow orders. Is that clear. I will not have any insubordination of duty on my watch, and that means, you had better learn to follow orders, or you will be asked to jump over board, and then go for a very long swim to shore.

Michael Jackson

Michael Jackson is the biggest joke in the world. He is a white boy, and he pretends to be related to Janet Jackson, a black woman, partially, and they pretend to be related, and he is as white as an elbow macaroni, or a white goose. He is not a black person, though he does have some black ancestry, but he is a primarily white person, and he pretends to have bleached his skin color, which is a crock of shit. Now, I want you to kill that mother fucker, as well as Sylvestor Stallon, and Arnold Schwarznegar, Clint Eastwood, Morgan Freeman, Kirk Douglas, Matt Damon, Robert De Niro, Anthony Hopkins, Gary Busey, and their Lesbianists' buddies.

Retractions

Mr. Jerry Springer is not a Lesbianist. I was mistaken about him, as he was already killed by them, in a previous lifetime, as he developed a desire to bad mouth them, and they didn't like him, and they kicked him out of their group, and they killed him, with their murderous torture routines. Penelope Cruz is not a Lesbianist, but she was, but they killed her, and tortured her, and she is off the list. Angelica Huston is not a Lesbianist. She was, but they killed her, after torturing her. She is a popular and prominent person, and if she hasn't been abducted yet, by the Lesbianists who will feed her to my abominant kids, like they did to Steve Irwin, and Jeff Corwin, then they will be gettting around to it, not too long from now, as they like to feed her to the abominant kids of mine, just as they do Bill Gates, and lots of other, former Lesbianists. None of the Baldwin brothers are Lesbianists, either, as they were already kicked out, and killed by them, and then grievously tortured by them. They continue to be main attractions for feeding to my abominant kids. Jack Nicholson is not a Lesbianist, now, either, but he was. Ben Affleck is not a Lesbianist, as he was also kicked out of their organization, after they tortured and killed him. Charley Sheen is not one, either, but he was. Martin Sheen is not a Lesbianist, but he works for them, and he was one, before they kicked him out, after they tortured him, and killed him, in a previous lifetime. Michael Douglas is no longer a Lesbianist, either, as they killed him, after their brutal torturing of him. He is up for being abducted, and for being fed to the abominant kids of mine, as he is a prominent person, and Kirk Douglas enjoys watching him get eaten up, and Kirk Douglas will laugh his guts out, as he watches Michael Douglas get tortured by the Lesbianists, which Kirk Douglas is a confirmed member of. Cher Bonno is not a Lesbianist, as I was mistaken in memory, though she was a leader for a while with Oliver North, she was killed by them, after being tortured, because she was getting "soft". Sunny Bonno was a Lesbianist, as well, but he was also killed after being tortured, officially kicking him out of the members league of Lesbianists. Sunny Bonno was captured, and abducted, and a body double was placed on a coroner's table, and Cher Bonno knew that the body double who was dead, who looked like Sunny Bonno, was not Sunny Bonno. The Lesbianists subsequently fed Sunny Bonno, after they captured him off the ski slopes, to my abominant kids. Elizabeth Taylor was thrown out of the corp of Lesbianists, after they heinously tortured her, and murdered her, and the Lesbianists have her slated, scheduled, after they find a way to abduct her, for feeding her to my abominant kids. Dennis Miller is not a Lesbianist. Though he was one, after torturing him, and sushi-izing him, please see my notes on that, the Lesbianist's sushi-izing of Dennis Miller eventually killed him.

It's hard to keep track of some people, as to whether or not they are currently Lesbianists. Others, are not so hard to keep track of, and I want all of those mentioned, killed, immediately.

On Praying, Fucking, Sucking And So Forth

You are rewarded for praying Nam Myeo Ho Ren Ge Kyeo. You are also rewarded for fucking, sucking, tounging, licking, fingering, dicking or massaging your dick against a woman's bun bun, or inside of her butt hole, where there are lots of sensitivities buttons that get her clicking and eroteming and orgasming, or against her titties to get her eroteming and orgasming, and so on, and for palming or massaging a pelvital button, or the love and joy stick, the dick, or a love button or love patch, igniter switch, or whatever nerve sending touch sensitive love joy button there is embedded into your body, in the pelvis, groin, vagina, and in the musculatures of the groin, pelvis, and vagina, with the palm of your hand, and so on. You also get rewarded for throating a woman with your dick, as there are lots of love buttons in her mouth, and throat, lips, and so forth. Men also have love buttons in their lips, throats, tounges, mouths, butthole, and on their body, and those buttons also get clicking, and turning on and off, and sending sensitivities messages or signals, nerve pulses, up the eroteming nerval system and up the orgasming nerval system. You

get rewarded for dicking men and boys in the throats, and in the buttholes, and their bodies, just as you get rewarded for dicking women. There is no discrimination in this area, and every one is equally rewarded for their meritorious acts of dicking others, women, girls, men, and boys.

Why are you rewarded for praying Nam Myo Ho Ren Ge Kyeo, and for dicking, fucking, and sucking, bumbeying, or moving your vaginal bumbey package against a woman's sexaling body parts to erotemize your self, and the woman, and for breasting your titties, i.e, rubbing your titties against or flopping them against and massaging them against a woman's butty butt or against her other sexaling body parts to get you and your friend sexually erogenized i.e., sexually stimulated, erotemized, and orgasming, and for other sexaling activities that help you and your friend and friends to produce purifying sexaling energies?

You are rewarded for your praying and for your fucking, sucking, dicking, and so forth, for helping to get every thing and every body going at the right pace in synch with every thing and every body else, for every body in my universe who is working for me, to keep them moving in harmony, perfectly meshed and in synch and in a timed persuasive mosture, with each other, so as to keep my universe standing up, strong, wholesome, robust, healthy, well, and fine. You are rewarded for praying as well as for sexaling, as you help move my children along as they do their work, as you pray and as you sexal and spray out energies from eroteming, from erotistically orgasming, and from sexually orgasmically convulsing, i.e., phlumetting, while you shatter out and spray out purifying energies in all directions, that will clearify and erase your karmic markups, and the karmic markups of others, all around you, for millions and more of miles, way out beyond where you are activiating and religialing, i.e., sexaling.

Your dicking, sucking, licking, titty massaging others, and so forth, will get wonderful and wholesome, GODLY, purifying energies shooting out of your bodies, and the energies shoot out at rates of speed that also help my universe to keep synchronized, and to move along at the right pace for it to be able to stand up and remain stable and solid, durile, strong, wholesome, pure, and a nice place to live in.

Every one who works for me, has a rate of speed they work at, a life pace, or life spin. We all have a pace of life. In some cities, it is fast and hustling. In some places, it is slow and whimsical. My kids work according to a rate of speed that is metered, and they keeps every one moving as best as they can, according to this metered pace. The metered synchronized pace that my children work at the rate of is one thirty seventh and one fifth, approximately, on the metronome.

If you help to push my kids along at that rate of speed, or a rate of speed that is close to it, as you pray at a metered synchronized pace and rate of speed, and as you fuck, suck, and so forth at a metered synchronized pace and rate of speed, then you are rewarded with angel

dusts, or purifying energies faerie dusts that my kids daub on your head, and throw buckets loads of over your head and body and that they wash your insides out with and that they wash your body, inside and outside, with as they shower them all over you on the outside of your body, and all around in your body on the inside of you, which then help to clean you up and clearify your karmic markups, cleanse your karma, and purify your life, making you a shining, radiant, pure and holy being, though you may not notice at first, as we are too filthy, karmically speaking, to notice the changes, as our karma is too thick and mucky to allow us to feel the changes that are taking place in our karma and life.

I have a gradient scale for how close you keep people moving, and at what rate of speed you help to push them along, and as you help to push my kids along, so that they can do their work, you are rewarded, in accordance with my gradient scale, with more angel dusts or purifying energies for better preformance, and with less angel dusts for poorer or less effective performance. You have to do some thing that will help my kids move along at a metered pace, so that they can get their work done. Praying Nam Myeo Ho Ren Ge Kyeo sets off a time frame synch. A time frame synch is the metered click, click, click, of the metronome. This time frame synch or metered pace, that you achieve while praying, Nam Myeo Ho Ren Ge Kyeo, will help keep every one moving, at the right pace, if you pray it in a rythym and at a rate of speed that will synch up with a metronome at one thirty seventh and one fifth, approximately. Your efforts to help keep my kids working and moving at a consistent rate of speed, will get rewarded, thus for praying, Nam Myeo Ho Ren Ge Kyeo, you are rewarded, with purifying energies, that my kids dump on you.

Your efforts for fucking, sucking, licking, tounging, titty whipping or banging your titty nipple against the vagina of a woman or girl, dicking, fingering, palming, and so forth, all get rewarded, if you try to keep every thing in synch with the metered pace of the metronome at one thirty seventh and one fifth, approximately. The gradient scale also applies, of course, as you are fucking and sucking, etc., so the better the job you do of keeping your pace at one thirty seventh and one fifth, approximately, the higher your rewards will be. Your rewards are the same, more or less, for both praying and for fucking and sucking, and my kids sprinkle and dump angel dusts, purifying energies, on you as a reward. You also get markups that are meritorious, and you are rewarded with a better and happier life.

Further, when you are orgasming, and eroteming, or pushing out energies as you orgasm, and erotem, you will be pushing out energies that shoot out at consistent rates of speed. These rates of speeds of these energies are in concordance with our pace of life, they all perfectly mesh with the paces of life that my kids keep. The energies as they pass out, and push along through time and space, at synched up and consistent rates of speeds, all help to keep my kids moving along

as they do their work and tasks, and they all help to keep our universe, standing up, strong, healthy, wholesome, well, and fine.

Chaos breaks the legs off the foundation to our universe, and our universe begins to creak and moan, as it begins to crumble, slide, twist, and tumble downwardsly. Making chaotic noises, and chaotic movements, detracts from the harmonics of our universe. Your breaking glasses, and breaking skulls, and legs, and arms, are also chaotic events producing, in most cases, and they will detract from the perfect synch up of our universe, as leg bones and arm bones, skulls, fingers and toes, begin to splinter, as you apply pressures to them, you get negative markups for your actions. A record is kept of every chaotic action you take, or make, and if you make enough chaos, in your lifetime, and in your following lifetimes, then you will suffer from your poor records of performance for keeping my universe standing up, wholesome, healthy, happy, and well.

Every scream you cause to be vocated or vocalized, is recorded, and the intensity of the scream, and yell, and crying out in pain, plus a lot of other factors involved, are all recorded by my kids, and you get negative marks for that kind of performance.

The love making oooohs, and aaaahhhs you cause to be vocated, are harmonic appeals of soothing restfullness to the spirit, and to the mind, are also graded, and you are graded on how well you can cause others to produce them, and your scores are kept, and if you are a lousy performer, with more negatives than positives, you'll end up with a lousy life, as a result, as you are rewarded in accordance for your positive performance, as well as for your negative performance.

Helping to keep all of my children working in harmony, and doing their jobs and tasks, at a metered pace, will be rewarded, not only with angel dusts, but also with a better life with more positive fortune, as you recieve positive points or merit points for your collaborating with my children, and working to support them, and more fun as your life becomes graced with more positive merits and as your rewards begin to pile up, and more good things begin to go on in your life.

If you sit on the side of your chair and have a pair of drum sticks, or are using a bongo drum, or calypso drum, with the long tube belly, or stack, a long barrel tubed drum, or if you sit at your drum set, or set up your electronic drum pads, and begin pounding away, in a syncopated manner, for your pleasure, just drumming away, with no notion in mind as to any thing other than achieving a nice rythym for you and your friends to listen to, if you happen to be with friends, your merit points will be near zero, and your efforts will not rate on my gradient scale, as your actions will not be in accordance with my program for a better universe for all people, and for my kids to live and work in.

If, however, you have the attitude, "I wish to support John's kids, and syncopate myself while I'm drumming, so as to be supportive of

John's kids, to help John's kids work in a syncopated manner, doing all I can to support John's kids", then, your merit points as you drum, will go sky high, through the roof, and you'll get meritorious benefits for your efforts, or merit points, and good marks, for your efforts. It's like helping kindly old women, who are frail and in need of a helping hand and support, cross the street. If you act in a kindly and charitable manner to help support those around you, you get meritorious points for your efforts. These efforts of your's, however kindly, regrettably, though they are kindly efforts, are not the kinds of efforts that we need, my kids and me, need to keep my universe standing up, and moveing strongly. For efforts that support my kids work environment, and that lend a hand to them to help them to get their work done, your meritorious efforts marks will go through the roof, and you'll be blessed with angel dusts, i.e., purifying energies that help to clean up your karma, and erase and clearify your karmic markups, or marks that record your bad and cruel, or negative actions towards others, and towards your self. You can kill your self, and cause grief to others, as a result of your departure, to my Epcot Center, and that rates negative marks and negative points markings or markups for you.

When you try to do any thing, that will help to syncopate my children, and to make my children's working environement more syncopated, and rythmical, with your concentrated mind, and determination to make that a reality, in other words, a prayerful attitude in mind, hoping to make John's children's working environments syncopated, and rythmical, and in rythym with every one elses', i.e., all of my other kids' syncopated working environements, then with that attitude of hopefulness, or a prayerful attitude, than, you are rewarded for your efforts, and determination, and as you drum away, or pound and beat on your calypso drum, or on your metal Bahamian or Tinian, or Haitian, or Jamaican, drums, or on your dresser drawers, if your mom does not mind, as you pound away, keeping your mind set on your determination to keep all of my kids working in unison with each other, and helping them to keep in syncopated harmony, all in perfect flux, and perfectly meshed in timing, with every one else, as they work for me, then your rewards and positive points markups, will be very high, and you'll be rewarded by my children, with angel dusts that they daub on your forehead, and dump all over you, from their barrels they carry full of angel dusts, or purifying energies to clearify your markups from your karmic markup piles, kept inside of your body, kept in storage in the molecules.

Your markups are inside the molecules inside your body, but they are also out side of your body, in every molecule, nearly, going way out to the very farthest edges of my universe. We will eventually get to all of them, and purify or clearify and erase all of your karmic markups, the notations and records that my kids keep on you, and on your activities, and eventually, we'll get them all, and your life will then be full of grace and happiness. It will be a long time before we get to all of them, as you and I and every one in my

universe, have been here, and enormous length of time.

As you drum, or skip, or dance, or do areobics, in syncopation, with the attitude that you want to keep all of John's kids in step, and in synch, and in unison and harmonicly meshed and in perfect flux with each other, or perfectly meshing with each other, and every one else who works for me, whether you drum, skip, dance, or do areobics, it does not matter, if your mind is set and determined to help my kids, with your efforts, you will be rewarded for your efforts, no matter whether you skip, jump rope, dance, or areobically excercise.

As you sexalate, if you keep in your mind that you wish to keep all of John's kids in syncopated harmony, perfectly in flux, and in unison, just as when you are drumming, or skipping rope, or dancing, or playing basketball, or playing tennis, or badminton, or any sport, with your movements all timed, and in perfect syncopation, when you sexal with the right attitude to keep John's kids in synch, perfectly meshed in perfect accordance and flux, with each other, and with every one else, you will be rewarded grandurally, that is, grandly, or in a grand or very great manner.

Excercising And Activiating To Music Timed To One Thirty Seventh On The Metronome

Music timed to one thirty seventh on the metronome, and one fifth, or as close to one thirty seventh on the metronome that you can get, is okay, and it will help you to dance, play tennis, play sports, do areobic excercises, and other types of activities, at that pace that we need to keep to help keep my kids working smoothly, and you'll be graded on your performance, and on your attitude while you are dancing, or excercising, and the more intently you concentrate and use your mental energies and mental control to stay in synch, and in step, the better will your scores be, and the higher your marks, and the greater your rewards of purifying angel dusts and purifying energies that my working and unionized kids will pour and spread all about you, inside and out, and all over you.

Sexaling itself is a religious act. Yes. That's true. But, if you sexalate with this powerful prayerful attitude, or hope in mind, with your determined mind, and your concentrated mind, as you sexalate, and help others to sexalate, and help others to erotem, orgasm, phlumett, and shatter off wonderful energies from orgasming, eroteming, and phlumetting, your positive points and merit marks, and many other types of scores my kids keep on your efforts and behavior, all of them will go higher than any one can see, way out beyond the furthest galaxy that you can possibly see from your bedroom window, with your telescope. They'll go out to the futhest edges of my current univerese, and even beyond the barrier walls, holding up our universe, that my kids put in, to keep our universe standing up, stable, strong, and durile or durable and with tensile integrity.

Any action for helping my kids do their work, syncopated, and in unison, and in harmony, will be rewarded, with angel dusts, and with positive marks and score points in your records that we keep on you and every one else in my universe. Your sexaling actions get rewarded, far more than any other activityating, as your sexaling actions are the most needed actions, to keep my universe, pure, durile, holy, sacred, free from negativities, healthy, wholesome, stable, and constantly in a state of improvementing.

Most people go around destroying things, and causing chaos. We, my kids and I, need people who are going to help improve the wonderfulness of our, my, yours, my kids, and all of my other kids, wether they work for me, or not, meaning, all of my guppies, who are like you, my relatively normal kids, as well as all of my abnormal kids, the abominants kids I've got, that go around thinking it is funny to eat people, and to pull them into their mouths, and crush them in miserable pain and agony, like my elephants abominants kids do to relatively normal human beings kids of mine.

Fisting And Punching People With Your Clenched Hands And Crasping Or Clasped Knuckles

You all have been bad kids, all of my guppies, all of you who do not work for me and go around thinking, 'Oh, gee. Aren't I special.' My guppies are these minded people, who are arrogant, who talk back to their mama's and to their papa's, and to their relatives, and brothers and sisters, and to their friends in school, and to their teachers. Later in life, they become worse, and they talk back with their actions of being mean to each other. As my guppies grow older, and become older people, they start fisting others, and that means, punching people, hitting them with their clenched fists and hard knuckles, and hurting them when they pound on their face, or on their stomach, or on their body some where, and break bones, and tear muscles, and stretch ligaments with their pounding each other.

Phlooching Out And Fisting The Vaginal Cavity, Rectal Cavity, And Mouthal Cavity

Fisting is a word used by some people to mean, to insert your hand into the vagina of a woman, and gay people, homosexually driven people, fist each other in the butt hole, if either men or women, or in the vagina, if women. Some people find it interesting to fist each other in the mouth, by sticking their fist inside the mouth of a person, pretending it is a dick or a dildoe. You need to phlooch out the neck muscles, and billow them up, or poof them up and out, and that will help them to gently relax, and then become expandable or stretchable, as when they relax, they will easily stretcth out, and there will be some give, or freedom of expandingness. The neck muscles then become easy to stretch and push on from the inside with out hurting the person. It then is easy to insert your fist into the throat, to massage the inside of the throat, and to use your hand, or fist, to tickle the igniters, and triggers that set off love buttons and bells, and whistles, that help women and men to erotem, orgasm,

and phlumett.

Fisting by inserting your fist into the vagina of a woman, when it is relaxed, and after you've massaged if for many hours, and after it begins to billow out, or poof out, and then open wide, and then you can see inside of it, and from the entrance of the vagina, there is a clear gaping cavity, you can then insert your clenched fist hand into, to massage the inside of the vaginal cavity. Doing this is very nice, and is very exciting to do, to help women and girls to erotem, orgasm, and phlumett. You can phlooch out the butt hole, by massaging it, for several hours, and it will begin to poof out, and expand, and you'll see a nanny gate face on it, and that means, it will begin to look a little bit like a vulva, or the vagina of a woman or girl when at rest, or exposed between a woman's or girl's legs as she is sitting or relaxed with no panties on or with no or few clothes on and nothing covering her hips, pelvis, lower pelvis, pelvital ridge, crotch and groin, butt and butthole and lower back, there by exposing her butt and vagina. If you compare a vagina with a phlooched out butthole, you will see they resemble each other, slightly. There is no vaginal cleavage of course, around the butthole, but there is a slight resemblence between a phlooched out butt hole, and a vagina, or vulva, none the less.

The Vagina And Vulva Compared To The 'Nanny Gated' Butthole

What is the difference between a vagina and a vulva? They are more or less the same, but the vagina includes lots of parts, inside as well as out side. The vulva is outside, basically, only, as far as I understand and remember these things, now. When you massage a butthole, long enough, it will begin to look like a vulva, or vaginal face. That's called the nanny gate, or on the male, the male butthole vagina, as I've spoken about it, before. On the woman, it is the female butthole vagina, a double 'immitation vagina' for the real one, as I've mentioned. Men's and women's buttholes are the same, and they both look like 'immitation vaginas' as I've also mentioned, after you phlooch out the butt hole of either the female or of the male. Once you phlooch out the butthole of a man or of a woman, it will poof out, and expand, and the butthole entrance and cavity will become relaxed, and easy to insert your clenched fist into, to then push up your fist into the butthole cavity, and massage it, once the person has cleaned out the butt hole cavity and once it is clear and free from debris matter, or food matter, and rotting food particles, and fleshy foods, or hamburger meat and so on. Phlooching out the vaginal caivity takes a little longer, but with patience, you can phlooch it out, and then fist, in this manner. If you phlooch out the butt hole, and rectal cavity, you can fist your male friends, and your female friends, and every one, once they have cleaned out their poop hole, and made it free from rotting debris, will enjoy mutual, and reciprocal, fisting. Fisting in this way, for sexaling, is alright. Fisting in the other way, for beating people up, is not nice, and you are given poor marks for your actions of nautyness, meaness, and cruelty towards others.

Over the long course of time, you all have been naughty at one time or another. I have many ways to fix you, and to retrain you, and to rehabilitate you, but you always go bad, and sour, again, as that is your main drive, or driving internal force in your lives.

The Importance Of Kindlyness And Teamwork

Why have all of my guppie kids all gone south, or in other words, gone down the road towards unkindlyness? Because, as I've explained, you forgot what the Love Of GOD is. My religion will help people to understand what the Love Of GOD is, and that will help keep them on the correct path of kindly actions towards others, and it will help them to understand and remember that teamwork to help my working, unionized kids to keep our universe healthy, strong, durile, standing up, stable, a safe and happy place to live, and a wonderful place to live, is very important.

Doing things that support my kids working efforts, will be rewarded, and doing things that detract from the harmony and syncopation of the metered pace of my kids who are working, and that slows them down, and that causes dischordance, will not be favorably rewarded, and you'll become a female schmuck, or a male schmuck over the length of time, as you live on in my universe. A schmuck is an unlikeable person. Sexaling is the most important thing there is for us to do, other than feeding ourselves correctly to keep us healthy, and excercising, and leading a balanced, well regulated life, listening to your mama and to your papa. My religion is based on sexaling, as sexaling is the most holy and pure activity we can participate in, or do by ourselves.

All the bullshit propaganda of the Lesbianists, that Jesus said this, and that Buddha said this, and that God will save you if you do this, and so forth, is pure balooney, bullshit, and made up nonsense. I, GOD, will not do any thing for any body, unless you help me and my children to make this universe, a more kindly, and a more wonderful and prosperous universe for all of us. If you do, I will have my kids, bless you with angle dusts as they daub them on your forehead, and then pour barrels of angel dusts over you, as they dump barrels full over your head and body, for your extra good work, sexaling, in syncopation, with my kids working rythyms, and in rythym with their syncopations, flux, and their phenomenal elegance.

Phenomenal Elegance

What is phenomenal elegance? It is their keeping harmony with each other as they work and keep every thing in order, in my universe for me, GOD.

You can not escape from this reality of your good actions and your bad actions being recorded, as my kids keep records on every one, and we make certain every one is rewarded for their good actions, and we make certain that every one recieves as close to what they deserve, to help balance things out, in accordance with their markups, for their bad actions. If they are bad, they will not meet nice people, and they

will meet naughty people, and not so nice things may begin to happen between them. If they are good, and if they try to help my kids, as I've explained about, they will get rewarded, and they will slowly begin to break away from keeping company with bad people, and they will gradually ascend to higher rankings or status, and then they will begin to lead a better life, and they will begin to escape from meeting with bad people, and the good kids' lives will become blessed by my kids, as my kids begin to sprinkle angel dusts on the good kids, and daub the heads of the good kids with purifying energies, and then dump purifying energies all over the bodies of the good kids who listen to their mama's and papa's, and sexal with them, and as they sexal with their mama's and papa's, and sisters and brothers, relatives, neighbors, and others, the good kids help my kids keep this universe running smoothly, in harmony, in flux, perfectly meshed, and in perfect syncopation. Mama's, papa's, sisters, brothers, relatives, neighbors, and others, all get their heads blessed with angel dusts, purifying energies, for their good actions along with the good kids, you, I hope, of course, too.

Plurlbalescent / Plurablescent Nature Of Negative Punishments And Positive Rewards

This is very important for every body to understand. I have my working, unionized kids reward the good people, and I have my working, unionized kids keep records on every action of every one of you, and I have my kids make sure the bad kids, meet with what they deserve, or some thing close to it, which may not be too nice, most of the time, and I have my kids make sure that the good kids, all meet with what they deserve, or something close to it, and that is usually always something nice. It may sometimes not be something conspicuously nice, but it is nice, usually, or positive in nature, always. The bad kids will get rewarded by something that is negative in nature, always, usually, or plurlbalescent. What does plurlbalescent mean? It means, it might not be noticably negative, but it is still negative, in nature, in essence. This is a topic we can discuss, another time, or you can ask my kids for more information on it, when you go in and visit them, with your mama's and papa's, sisters and brothers, relatives, school teachers, principal, costodians, janitors, school workers, and others.

We have had too much chaos of late, and for quite some time, and it is now time to slow it, and bring it to a halt. We are going to produce positive harmonic concordances that will assist my kids as they work, and that will help them to stay working in harmony with each other, with your fucking, sucking, eroteming, orgasming, your shooting out of purifying energies as you orgasm, and erotem, and with the increase of the oooohs, and aaaahs, you help to produce, with your practice of my religion.

We have to bring an end to the moronic violence of the Lesbianists. If that requires a lot of my children, making lots of babies, and lots of

energies, and percussive forces, when you set off a fracturable rock bomb, then that is what it will take, as you blow Washington DC and the Baltimore metro area off its ocean ledge, and into the Atlantic, with that fracturable rock bomb, if it is big enough. Yes, there will be lots of painful, ouches, and screams, and so forth, but it is trite, compared to the violence these idiots have been perpetrating, over the long span of time that they have been in my universe.

We have been here for a very long time. It is nearly impossible to figure out how long, other than with mathmatical computations. Our brains will burn out, if we try to figure it out in our heads. It does not matter how long we have been here. It does matter what we do while we are here. You are not going any where else, and you are all staying in my universe, so you will all drop your pants, and your dresses, remove your shoes, socks, clothes, underwares, panty hosees, and panties, disrobe, and begin helping others to make lots of ooohs, and aaaahs, and lots of eroteming and orgasming energies. That will be the begining of your getting into line with the rest of us, here in my universe, my kids who work for me. As you eroto with each other, you'll get graded on your performance, and you'll get paid by my kids, once you join our country, as I've explained about, before.

Timed Persuasive Mosture

What is a timed persuasive mosture? It is just keeping every body in synch with each other, persuasively and accurately moving along, orderly, in an ordered fashion or manner, and with every body in rythm and syncopated with each other.

Mosture is a type of motus, or motion or fluidity of movement. The timed fluidity or fluidness of my kids working along in synch with each other, is critical to having every thing in my universe, standing up and sturdy, with every thing holding together, as it should be. Otherwise, if my kids and their work get out of synch, things can come crashing down, and things can come falling apart, and we do not want that.

This is a big universe, and we have a lot of people in it, my kids, and you wouldn't believe how many kids I have. Anyway, they all have to stay in syncopated, fluid motion, with their paces of life perfectly meshing with each other's paces of life, to accomplish their jobs and tasks, in an orderly, and in a fluid movement, harmoniously, and without delays.

The persuasiveness is accomplished with the help of your sexaling, and by your keeping pace, and synching your sexaling activities, and the movements involved in your sexaling activities, and by your spraying out your energies, as you erotem, orgasm, and phlumett. The persuasiveness is also accomplished by your keeping pace in unison with others while you are praying the syncopated phrase, Nam Myeo Ho Ren Ge Kyeo.

Every thing is timed, and so as you activiate, or carry out these activities of sexaling, eroteming, orgasming, phlumetting, as well as the movements involved in sexaling, and as you pray, your synching of your movements and sounds in time and in pace with the syncopated and metered metronome click, click, click, at the timed pace of one thirty seventh and one fifth, on the metronome, approximately, helps to persuasively move, or persuasively drive and push, every body about, and along, as they do their work for me, in their many syncopated paces of life, or life spins. I have many children working at different life spins, as I've mentioned before, and each group of them has a different pace of life, or time spin. Your activiating, as explained, helps drive them along, each at their own pace of life, or time spin, perfectly meshed with every other child of mine, also in his or her, and at his or her own particular time rate of speed, time spin, life spin, or, pace of life.

Every one and every thing must move along in perfect flux, or perfectly meshed with every body, and with every thing that is going on in my universe, on every possible level. There are many levels where activities are going on, and many people are working at different life spins. Every one, no matter what level they are on, and at no matter what life spin they are living at, must stay in flux, perfectly meshed and in perfect harmony, perfectly syncopated with every one, else.

You are rewarded for your helping to move my kids along, in perfect flux perfectly meshing with every one and with every thing that is going on in my universe, with your efforts at sexaling, and with your praying, as explained, earlier.

In our new society, which we will create, you will score earning points, and every thing you do, as you sexal, and so forth, and as you pray, is scored, and a record of your capabilities, or excellence, or lack of excellence, is kept. You are paid according to your work performance, as you sexal, activiate, pray, erotem, orgasm, and phlumett. Also, you are graded on how well you get along with others, and on how well you try to harmonize and then sexalate with others. You score earning points, accordingly, and you get paid, according to how well you perform.

Keeping Every Thing And Everybody In Harmony And In Synch

Explaining how this works, how praying, fucking, sucking, dicking and hugging, etc., helps keep every thing in synch and in harmony and how your efforts are rewarded, is a tiny bit more complicated than my simple explanation, but that is it in a peanut shell.

For those Lesbianists hiding among you who do not wish to surrender, you Lesbianists will find we are not going to be acting kindly towards you. All of you Lesbianists, where ever you are in Washington DC, or hiding underground, or in Paris, or in Rome, Peking, and so forth, you will be dealt with harshly, as we need to put a stop to your activities, and a "maybe" is not acceptable in this case. We are not

going to allow you to continue your chaotic, nonsensical, violent activities one moment longer, and we will blow you up flying high up into the sky, and off the ocean ledge down below you, in Washington DC, as we sink your Washington DC area into the ocean, along with all of Northern Virginia, and the ocean coastal area of Maryland and Baltimore, along with large parts of the states of Virginia and Maryland, out to West Virginia, as that area settles down into and below the waves of the Atlantic Ocean, after we bomb it with one or more of my fracturable rocks weapons for mass removal of Lesbianists from the face of the earth and from their hiding places under the surface of the earth. The Lesbianists in the Washington metro area and hiding under it, had all better surrender to my kids, or they will all get their pants and clothes blown off and shredded from their bodies, if they do not, as they are given a free ride out and up into the upper atmospheres of our planet, and then, beyond. All other Lesbianists had better surrender, too, or they risk getting a free ride out, as well.

Deep Sea Ocean Trench Off The East Coast Of The United States

There is a trench that extends south wards from Washington DC, some times reaching 25 miles out in some places, and in other places, it reaches out to eight hundred miles from the shore. In the north, it reaches out in some places, 85 miles out to one hundred and twenty five miles out, to three hundred and fifty five miles out, to eight hundred miles out in some places, in the south.

It is fifteen miles deep when you go out forty five miles off the coast from Washington DC and from the Chesapeak Bay. The ledge bottom is found about three and one half miles down, and the mouth of the opening continues for ten miles, approximately, downwardsly, on the western side of the trench. The It has a gaping mouth, and it opens up and lets ocean water inland, under the continent, eighty five miles down below Washinton DC, three to six to eight miles wide, from top to bottom, from the underside of the top of the mouth, the bottom of the ledge, to the bottom of the mouth. From under the nation's capital, to the south, it travels to over eight hundred and eighty five miles. To the north, it travels three hundred and thirty five miles, to six hundred and fifty miles, to about nine hundred and fifty nine miles, inland under the continent, depending on where you wish to locate the edge of it under the continent, northwardsly. It travels to the west, inland, three hundred and thirty five miles, to just over eight hundred miles, depending on where you find the edge of it. It travels inland further westardsly, the further you travel north. It is slightly over one thousand and eight hundred miles from north to south, in total, as you'll discover, once you explode enough, and after you explode large enough fracturable rock bombs, over Northern Virginia, Maryland, Washington DC, Baltimore, covering the metro area vicinity.

The U.S. Navy, and the U.S. Coastguard know about the trench, or parts of it. They are not allowed to discuss it with anyone. No one is allowed out there, to research it as it is off limits to just about every one. Some navy personel of high rank, and coast guard personel of high rank, are allowed out to take soundings, every now and then, with their Lesbianists' staff members, and Lesbianists' personel in the Navy, and in the Coast Guard. The Soviets, at least, Boris Yeltzin, Vladmir Putin, Mikhael Gorbachev, and Zelda Gorbachev, know about it, and so do all the other Lesbianists. They can confirm it, if they wish to play ball with me, and if they wish to save their asses, after they decide to surrender to my children.

The Shelfs Systems And Trenches Systems

The shelf estends to under Lexington Kentucky, at about ten miles below it. It is five miles up under Chatanooga Kentucky. It is five miles below Washington D.C., in some areas. It is three miles below Baltimore Maryland, in some parts of the city. It is eight miles up below Pittsburg, Pennsylvania. It is fifty five miles up below, or under, West Chesterfield, New York. It comes up to eighteen to thirty miles below McLean Virgina. It is eighty eight miles below Norfolk, and the mouth, downwardsly, is five to ten to fifteen miles wide open, in a downwardsly direction. It some areas, it can be found below Ohio, and under Indiana. It crosses under the West of Kentucky, and into the south of Illinoise, five to ten, to thirty miles. It is a variegated trench system. It extends to Tennissee, parts of North Carolina, Mississippi, Alabama, Georgia, South Carolina, and to under parts of Northern and Western Florida, and is open out and into the Gulf of Mexico. The whole area of Eastern U.S.A., is sitting on an open shelf, trench system, and there is water passing below it, and out into the gulf, in several areas, over to eighty five miles west of Corpus Cristi, Glen Garden, population eight hundred and fifty, which south of Galveston, and north of Corpus Cristi, between the two cities. There is a mouth eigty five miles south of Tampa Bay, Florida, in the Gulf of Mexico. There are several openings or mouths to the underground fault line system, and deep sea ocean trench system, and shelfs systems, and water is passing from the Atlantic to the Gulf of Mexico. There is also a trench system in the north, under Niagra, that extends southwards, several hundred miles, and it has many branches to it, and it extends into this system of shelfs, trenches, and under continental water flows.

Side Bender Currents

What is a side bender? It is a current comeing out of the mouth of an opening, from under a continental shelf system, that allows waters to flow out. As the water flows out of the mouth, the outlet current of water, it flows very forcefully in an outwardsly direction, and it pushes the water out with great force, generally. If a submarine is traveling in the vicinity of a side bender, the submarine may get hit broadside, and that will often turn the submarine topsy turvy, and around facing the opposite direction it was traveling in, or another

direction, not the one it was traveling in, most often. The crew will get swung about inside the submarine, and they will fly through the cabin, and pounce off the floor to the ceiling, and hit the ceiling, and then hit the sides of the corridor they were walking along in, and finally end up on the floor when the submarine rights itself, with its balast, and you'll get many sprained or stretched ligaments, and broken bones, arms, wrists, fingers, legs, knees, ankles, feet, toes, necks, backs, hips, spinal injuries, and other injuries. It can leave a crew of a submarine nearly one hundred percent, injured and in a ship's hospital, or a Navy or military hospital for recovery. Side benders are often called upwellings of currents by the Navy, but that is not generally the case as they are not upwellings, but they are side pushing currents, that come flowing out from under continental water flow openings, horizontally. There may be some upwards lift involved, if there is a reason, such as a mouth is angled at a slight sloping angle, as it releases the flowing waters out from its tube like cavity or hole.

Crew members and military passengers of Naval submarine vessels are generally told not to talk or discuss any thing about side benders with non Navy persons, and with persons unrelated to their ship or unrelated to their ships voyage, as the governments of the world, do not want any one to find out about side benders, and they do not want people, geologists, marine geologists, undersea deep sea ocean studies researchers, or others, to research and investigate side benders. It's a big secret, these side benders, and that's what the marines, and the navy personel are sworn to keep, or face a fireing squad, on insubordination, or on some trumped up charge of spreading naval secrets, acting as a foreign spy and receiving money, or something like that. Naval personel will generally obey orders, and not discuss side benders, or other 'secret' information, with any one, as they risk losing their job, and they might face a fireing squad, or a hanging patrol, sometimes called a marching platoon, or a hanging platoon, a group of soldiers commissioned to carry out orders to hang some one who is in the military. If you pay a naval officer or enlisted person, or other person with Naval submarine duty, such as some marines, and others, enough money, they may be willing to share some information on side benders, and information about what they know about side benders. Some persons who have had Naval submarine duty, may genuinely not know any thing, such as crew members who are never assigned to submarines that travel near side benders, on a regular basis. Some times family members of enlisted persons and of Naval officers, are allowed to travel on submarines, for fun and excitement, as a special reward for their papa's or mama's duty on a submarine. Some of these family members have also had some experience with side benders, such as those who have traveled on submarines along the Marianna's trench, or other trenches, not listed, neccessarily on global maps, but none the less, which are there, and that are near shelfs systems under sunken continental shelfs, or under sunken continents, but that eject streams of water, nonetheless.

Our maps and globes of the world are incorrect, the ones we buy through bookstores, or from map publishers, as nothing that would indicate sunken continents, large sunken islands, and related trenches, or other related features, are not going to be indicated on them. The Lesbianists do not want you to find out information that could provoke you into researching, under water features, that they do not want you to know about, as your fictious understanding they have taught you, of the surface of this planet, and its history, is bogus, and any thing that would conflict with that, is certainly not going to be indicated on a map they would publish, and the map will be wiped clean of all traces of any thing that conflicts with the 'global' history of the earth, as the Lesbianists teach it, in geology courses for high school students, and below, and above. The global geological history they teach must coincide with their fictious propaganda about Adam and Eve, and "Lucy" the ape woman, the supposed mother of all people living on this planet, and about this earth being only 9 billion years old, or thereabouts, which is a bold faced lie, and other such bullshit notions they have fed every one to swallow, and have forced them to accept, and that they force people to use as primal notions to base scientific research on. The geology of our planet is much more complex than the Lesbianists are letting on to, and there is much to learn about planetary geology, as these planets have been around a very long time, and many things have happened, over and over again to them, and many things have happened to our 'solar systems', and star formations, and star systems, that people need to know more about, to get a realisitic understanding of our universe, its history, and its many complexities. In time, we will learn much more about all these things, and you can attend courses that my children have set up for every one, to teach people about our universe. You need a day pass to visit, as I've explained about, before, and then you should swear in, and become a citizen of our country. We have yet to declare this planet ours, but in time, we will, once we have finished and put an end to the problems associated with the Lesbianists, all of their shenanigans, and their malarkying around. One day we will declare this planet ours, and my kids will take charge of everything, and they will appoint people to posts of duty, and to positions of responsibilities.

Making A Large Swimming Pool

People should begin moving off and out of the area, around the Nation's capital, Virginia, Maryland, Pennsylvania, West Virginia, and North Carolina. We'll have a big swimming pool there, with lots of, mostly uninhabited, tiny islets, or hill tops and mountain tops, after all of the current residents die, and pass on and transel over to my Epcot Center, after one of our compatriots, or groups of them, detonate enough of my fracturable rock bombs. People will have to watch out for hungry sharks, after they swim inland, above the sunken landscape, looking for corpses to eat, and to scavenge, as lots of Lesbianists' corpses will come floating up from underground hangouts and cities of the Lesbianists, under those parts of the U.S., and from under the Gulf of Mexico, from under the sea floors of the Atlantic,

from under the Niagra trench systems, and from under other trench systems in the Eastern U.S. This is not a joke, by the way.

Stagnasis

Salts kiddies in stagnasis is when the salts kiddies are in their salts kiddies crystals cages, in a hibernative state, in perfect equilibrium, to keep them alive and well, for as long as possible. Salts kiddies crystals cages sciences help you to understand many things about how things work in nature. Please read over my notes on my bulletin board.

Black Powder 'String' Fuses

Take a spool of sewing thread, and use Elmer's glue to coat the string, and run the string with a thin layer of Elmer's glue coated on it, through a bucket of black powder gun powder, which you can order in the mail, over the internet, or pick up at an antique musket or old style 'cap and ball' musket rifles and pistols retail stores.

Elmer's glue and gunpowder will combine to form a minor plastiques explosive, after the salts kiddies mix it up, eat each other up, pee and poop out lots of stuff that is highly explosive, as they get busy making babies, except when gunpowder is used in large quantities with Elmer's glue, to form a major plastiques explosive. Benzine will help this along, with diesel fuels, as well, and with chlorine, we can see some major plastiques explosives in the making, as mama's and papa's begin making lots of children, as they begin mixing it up, and as they all begin pooping and peeing out body fluids that is food for others, that will contribute to the powerfulness and explosiveness of the mixture.

After you make your string fuse, and let it dry out for a couple of weeks, then coat a rag or muslim cloth in oil, or grease, or a mixture of turpentine, gasoline, diesel fuel, and grease, with benzine, and make a paste, and use that paste to coat a thin cloth, such as a muslim cloth, and then let that set and dry for a few days, and then wrap a few sets of 'string fuses' together in a bundle, and place them inside the cloth. It will become a very powerful explosive, in itself, the more gun powder you use with it.

Test it, to see how fast it burns once it is wrapped in a cloth coated with a mixture of grease and fuels. The thicker the grease, the slower it will burn. The thinner the grease mixture, by adding more turpentine, or benzine, or paint thinner, the more rapidly the fuse will burn. You will have a very powerful explosives cocktail, with this mixture, so be careful. You have to be very careful with what you combine, as you'll be bringing together very explosive elements, when you mix these fuels and liquids together with gun powder on a string.

A few string fuses, wrapped in a well soaked cloth, with a mixture of these liquids and the axel grease, will make a type of plastique explosive, that can be used as a shape charge, or a mouldable, or

shapeable, explosive, that is good for blowing doors off hinges, such as at pharmacies, or banks, and for blowing locks on private homes' fences to pieces, such as can be found at the White House, at 1600 Pennsylvania Ave. Washington, D.C., at the entrances and exits gates of the White House where guards are on constant duty patroling the area for security purposes. An initial explosive, a detonated fracturable rocks bomb, small in size, may cause a concusive force to cause the guards to black out, and pass out, and then sleep for a while. Be very careful with the size of the bomb, as we do not want to level the homes and buildings surrounding the White House, or across from it in Layfayette Park. After you put them to sleep, with your initial blast, you can test the shape charge on the nearby fences, at the White House.

Black Powder 'Cap And Ball' Pistols

Most black powder cap and ball pistols and rifles, muskets, sellers and retail outlets can be found on the internet, and some gun shops carry black powder, as well as the detonating fireing caps, for black powder rifles, and pistols. Many of them do, and you can purchase the black powder and copper detonating, ignition caps, for useing in your cap and ball pistol, or musket, or other, more modern, hunting rifle, that allows you to use black powder, and detonating copper caps that slip on a small round fireing ignition nipple that is made out of steel, and has a hole in it, to allow the percussive explosives in the firing copper igniting cap to ignite on impact with the hammer on the weapon, when it slams down on it, and the flames from the igniting explosives mixture, glued to the inside of the firing copper cap, then ignite the black powder, that was rammed down the barrel, or packed and tamped down in a cylinder of a percusive black powder cap and ball pistol. The caps are fairly useless, unless you wish to add them to a fuel oils, chlorine formula, and let them sit in the fuel oils mixture, and that will help develop plastique, as well.

Higher Temperatures Develop More Useful Energies For Making Babies

The copper in the cap will also allow for a higher temperature in burning, when the fuels mixture ferments after a few weeks. Magnesium in the cap as well, will also help to raise the burning temperature of the fuels mixture, and with some black powder added, and with some chlorine added, your plastiques recipe will become even more useful. These higher temperatures will help to produce energies that will be conducive to baby making among the fracturable, or rupturable, and percussive, rocks radiological salts kiddies. You can then add a handful or more of powderized amethysts, or turquoise, that you can purchase in bulk, on Ebay, for some small bulk quantities, and also emeralds are useful, as they all have fracturable rocks kiddies embedded in them, and fast asleep, in stagnasis.

Zircon Diamonds, And Other "Radio Active" Gem Stones, Etc.

Zirconium is a mineral that they use for the fake diamonds they sell with the trade name, Zircon diamonds, or Zirconium diamonds. You can powderize them, and use them for a good amount of fracturable rocks explosives, large and fast family making, salts kiddies, for a 'nuclear' party, and a send off to the eastern coast of the United States, before it is blown off the coastal ledge it sits upon, and then sinks below the ocean waves, if you strike it hard enough, with one or more of my fracturable rocks babies making, "nuclear" salts kiddies bombs. You'll need a few handfuls of Zicon diamonds, powderized, to make a nice fracturable rocks, babies making bomb. You can mix turquoise, emeralds that are mined and sold in bulk quantities on Ebay, amethyst, and the other rocks that I've mentioned, along with powderized 'sand' from the beach. Argentina, and Venezuela, Baha, and Southern California are good places to collect useful sands, full of fracturable rocks, salts kiddies, that a geiger counter will detect, if it is a sensitive enough geiger counter.

Geiger Counters And Their Usefulness

They are not too hard to build, but you will have to look in your Popular Mechanics magazines, for the details on how to build a "geiger counter". Some mining stores, and mining outfitters stores, may be a useful places to order or purchase a geiger counter, if you are on a family budget. You might find one on the cheap, on Ebay, that is still useable.

There are some kits available, if you look hard enough, to use to build your own geiger counter. A mining outfitters store, in South America, or in Central America, or in Utah, or in Nevada, may be able to help you locate a kit, to put together, if you go in there, and pretend you want to go out and look for interesting rocks, and you need some information on where to look for interesting rocks, so go to a mining outfitters store, or to a rock hounding club, or rock hounding retail store, for looking at beautiful stones that rock collectors, or rock hounds, have found, and made available at the store. Usually the store owner will have his or her suppliers, on name cards, and you can get in touch with them to get more information on where to look for interesting rocks to test with your geiger counter, since you are facinated by radioactive elements in rocks, and you are interested in finding some, for a collection you wish to start.

You might want to pick up some primer books, on minerals and rocks, gems, and gemstones, from Amazon online, or from a local book store, such as Barnes and Nobel book store, which has a few useful books on rocks, mineral rocks, gems, and gemstones, that you can find when you are out rock hounding. Desert Outfitters in Las Vegas, a miner's outfitters store, that also provides useful tools to rock collectors, such as rock hammers, and hand held pick hammers, for chipping away at rocks, to see what is under the surface of the rock, or under the peel of it, the outer layer, as well as terrain maps, and outfitting supplies, tents, and sleeping bags, and so forth, has these types of books, and lots of maps, and maybe they can help you find useful kits

to purchase, to build yourself a geiger counter. They also sell geiger counters for about three hundred and fifty dollars or so. Sears used to sell Geiger Counters, and they still can order them for you, I think, through their catalogs. On Ebay, you can find many reasonably priced Geiger Counters. How well the geiger counters work, the ones people sell on Ebay, I can't say, so you'll have to talk with sellers, and see what they say about the geiger counters they are selling to others on Ebay, or read about them in old copies of popular mechanics, and in trade publications for the mining industry.

Novice And Amateur 'Rock Hounding' Rock Collectors Clubs

On Sahara, east of Las Vegas Boulevard, there is a rock shop, which is about two and one half, or so, blocks down from the intersection, on the north side of the street, and they have information, as well as lots of primer books, on rocks, and on geiger counters, and where you can find them. They are well connected to the local rock and gem, minerals and gems finding, or rock hounding clubs. You can meet their members, and go out with them, on excursions, as they know where to find just about anything.

There are similar clubs in every major city, and in lots of smaller cities. Mining towns of course have lots of mining outfitters stores, and they probably have geiger counters for sale, so you can use it to find some very nice, fracturable rocks, along coastlines, or in ancient dry lakes and seas, sediments filled, rock hounding areas.

Decontaminating Your Self With Ocean Salts

Acidic ocean salts in ocean water will help eat up the radiological kiddies that find their way into your bodies, and that make you feel ill. It might take several weeks for initial recovery, with you taking large amounts, several teaspoons or more, as much as you can handle, in your diet, every day, for up to three to eight years, to thirteen years, for severe contamination, and for full recovery. Other things, such as nutmeg, and oregano, in a salty tea brew, will also help you, and marijuana in the salty tea brew, will further help you. Berries can also be of great benefit for recovery from radiological salts kiddies contamination.

My kids have a recovery kit, that will help you recover from an overdose of radiological salts kiddies, after a major birthing event, and that kit will help you fully recover. You need to join our country, and swear in, and become a citizen, to be given one of these kits to help you for your recovery. They can provide you with information, of various kinds, once you swear in. They have you swear in as full time citizens, now, except in special cases.

Ancient Dry Lakes

There are many ancient dry lakes, up north, in the colder areas, of Manitoba, and around the edges of wet lakes, you'll find areas that dried out, a long time ago, and you'll find interesting things in the

sediments deposits under the surface soils of the earth, that have covered most areas, and that come in to our atmosphere, and then deposit themselves onto the surface of our planet, as they are blown in on the solar winds. A few feet of top soil may cover the dry lake areas, around the edges of these lakes, and the soils depths may reach to twelve feet, to fifty feet, to sixty or to eighty of more feet, in some areas.

Once you hit the sediments layers, around the edges of these lakes, outwards to eight to fifteen miles, to thirty miles or further, out to up to eight hundred miles, as in the case of Lake Erie, and that lakes region, the Great Lakes, that all use to be one large salt water sea, but is now, a fresh water set of lakes, you can begin looking for the radiological bullets of the previous catastrophes in my universe, that shot out radiological salts kiddies, into the sediments rocks of mineral stones, and sand. Gravels might contain some "radioactive" fracturable rocks, and you can tell which are the useful ones, with a geiger counter. There are still salt water lakes up in Manitoba, Lake Huron, and some others, that used to be part of Lake Erie, and all part of the Great Lakes, when they were a large, salt water sea, but which are now, no longer part of that lake region system of lakes, as fresh water now fills up the Great Lakes from under ground water systems of fresh water flows.

Hydrolific Pressures From Water Falls

Hydrolific pressures, from water falls, primarily, help to erode and carve out and build the under continent open areas of water flows, that flow under the continents, and that dump their waters by traveling underground, in culvers, and channels, and in trenches systems, and then flowing out and into the oceans, resulting in side benders currents and flows.

Underground Lakes

Hydraulisis is one type of water pressures. Hydrolific pressures are those pressures created by water beating down, steadily, as water falls from higher to lower places, creating underground holes, and large open underground cavities, and water holding vessels, aquafirs, and underground lakes in the underground rock layers. Lots of cities sit on top of such underground lakes, on the crust of the surface of the earth, or very near to them. The lakes are often ovular and rounded in shape, from top to bottom. Many former water falls, are now low lying, and flat, and there is no water fall on the river, except for minor, cascades, such as found in the Grand Canyon Rift Valley down the Colorado River, and out into the Baha area.

Baha Mexico

Baha is a good place to go looking for interesting, "radio active", or radiological rocks, fracturable rocks with radiological salts kiddies sleeping soundly, embedded into other rocks, after colliding with

them, in a hail of radiological rocks bullets, after a planet or a galaxy, or a large nebular star system, or a cluster of them, were detonated, by some fool with a huge and powerful, home made bomb. This happened, often, in the past, and still, today, it happens, now and then. Bits and pieces of the radiological rocks will come flying in, and then embed themselves into other rocks, as I've explained about, before. We've had so many catastrophes in my universe, that our ancient rocks, are peppered with radiological rocks that are embedded in them. Off the coast of Baha, is a good place to go diving, looking for rocks that were washed off shore, as waters flowed down the Colorado River, trinities of aeons ago, when this planet was still a young planet, maybe about one fifth the way through its infancy, after reforming, again, after its last major impact that shattered it to pieces, for the umpteenth kazillionth, plus more, time. This shattering and reforming, has been going on too long to count, and obviously, there is a large amount of mixturing going on, with debris from other star systems, galaxies, nebulas, and so forth, floating in, and becomeing part of our planets, all around and about, on solar winds. You'll find rocks on the inside of the Baha coast, and on the outside, as well, and along the Baha coasts. You might have to dig down thirty of fifty feet, to a few hundred feet to find them, maybe eight hundred feet, or sixteen hundred feet, or further, but you'll eventually find something useful with lots of radological bullets embedded in the rocks.

Finding Good Rocks With 'Radiological' Salts Kiddies Bullets

You can find interesting rocks, also on high hilltops, such as in the Andes, the Himalaya's, the Swiss Alps, high mountains in Austria, and in Germany, high hill tops and mountains in Iran, maybe in Afganistan, and the very high hill tops, that are generally old hills, in many countries. They will usually have, if they are very old hill tops, lots of rocks scattered about that are very old, and that have lots of fracturable 'radiological' salts kiddies 'bullets', from previous detonations around my universe, and other related kiddies in them, as well. You can also find them along ancient river beds, and along dried up desert gulley washes, in the valleys between the mountains, in areas where tall, old mountains exist. You might have to dig down into the underlying layers of rocks to find really ancient rocks loaded and peppered with ballistic radiological 'bullets', tiny fragments of radiological materials that went shooting out upon detonation of nuclear materials, elsewhere in my universe. Geiger counters will let you know if your sample rock material is pacted full and loaded with the tiny radiological 'bullets', or just partially loaded with them, depending on the response from the geiger counter. Many types of radiological materials, the bullets fragments, may not register on current day geiger counters, as they are not set to the correct radiological energies frequencies and currents settings to be able to detect them in the rocks. There are many types of radiological rocks in my universe, and current day geiger counters are set to pick up the currents and frequencies of the energies from only a few types of

them, and there are thousands of types of radiological materials, so the older the rocks that you find, the more likely that the loads of radiological materials in them will be high in not only the types of radiological materials the geiger counter can detect, but also, in the types of radiological materials the geiger counters are not set to the frequencies and energies currents of. Such samples of rocks materials with large amounts of fracturable rocks, radiological 'bullets' inside of them, will yield massive explosive potentials, if you raise the heats energies of your explosives formula, to near solar temperatures, as I've mentioned about.

Plastiques, Explosives, Radiological 'Bullets', 'Nuclear Detonations', And Decontaminating Yourself Of Radiological Salts Kiddies

Please see my web pages for information on making plastique, along with metals fragments, and high temperature burnoff minerals mixtures explosives to produce the energies needed to produce nuclear detonations. Field chemists and explosives experts should be consulted, as they will probably know more about the temperatures at which different metals and minerals burn at and they will be more helpful in providing you with accurate information on different alloys mixtures, and the temperatures they burn at, such as the new US Mint US dollar coins, that will burn at extremely high temperatures, at about one fifth to one third the temperatures of solar temperatures, when ground into fine dusts fragments, and then after fermenting them, and then mixing the fermented particles in with the petrol fuels, chlorine, and gun powder, etc., plastiques explosives formulas, as I've explained about, to some extent, in my notes on my Gurkian Age Gurkian Way bulletin board. Be very careful when testing, as you may find the results extremely hazardous. See my kids, for more information, as I've explained about, on my bulletin board. Ocean salt will help to decontaminate you of radiological salts kiddies. A two hundred pound man will need about three pounds of ocean salt on a daily basis, to live healthfully. To decontaminate yourself, you will need more than that, to properly get rid of the radiological salts kiddies in your bodies, after you've been working with radiological salts kiddies, and testing the explosives potentials, for some time. See my bulletin board for more information on the 'salts kiddies sciences' to help you to understand what is going on in so called, 'nuclear detonations'.

Sledgehammering Continents And Land Areas Where Lesbianists Live, Hiding Below

Here are a few places to place some other fracturable rocks bombs on, to make them fall in, and collapse down onto the layers of rocks, below, and then puncture the ceilings of the cavernous cities the Lesbianists have made, down below those lower rocks layers. Topango in the South Pacific near the Marianas, the area midway between the Ryukyu Islands and Haha Jima, Chichi Jima, and Iwo Jima, where you will find a sunken continent, Wellington New Zealand, Peking,

Falklands, Urals Mountains, Chile thirty miles north of Concepcion and eighty miles east of it, near the Argentina border, and the Kamchatka pennisula, which will split and collapse in the center of it, midway down the penninsula, if you hit it hard enough. Lesbianists will come floating up, if their bodies can fit between the tons of debris that will fall in on them, as you smash the land sites that sit on top of ocean shelfs, and on open lakes below the land, some miles down from the surface, in some cases, and further down, in other cases.

It may be hard or impossible to deliver a nice bomb below the ocean above or onto the top of the sunken continent below the ocean, between the Ryukyu Islands, or Okinawa, and the islands of Japan, called, Chichi Jima, Haha Jima, and Iwo Jima. If one can be delivered there, you'll crush the continent below the surface of the ocean, and that will cave in on the cities, there are more than one there, that are below the protected shelf layer of rocks, above the cities the Lesbianists have there, below the sunken continent, to live comfortably in. The other places aren't so hard to hit. It is just a matter of local interest, and urging of the people there, to take the correct action to help us to resolve this problem, of Lesbianists living below us, all around the globe, in their honey comb, bee hive like canival of cities.

A canival of cities, is a large collection of cities that is located in such a way as to make it easy to get from one place to another. They are conveneint for them to live in as they are well placed, and spread out evenly, using the full extent of the area, as efficiently as possible. The Lesbianists have a canival of cities under the lower rock shelf layers, that are above them, and that help to keep them protected, warm, dry for the most part, but not always, and that are conveniety located each one in a bee hive like, configuration, well placed, with a well designed, layout, with central cities, and with satelite cities. It is well designed and resembles in part, Melbourne Australia, which was laid out, planned and designed as a modern city. The Lesbianists of course, think Melbourne is puny compared to their accomplishments, and of course, with the technologies they had and have available to them, from time to time, they made good use of every inch of space they have available to them, under the lower hard rock, but leaky rock layers above them.

My kids have places and locations maps of all the best places to locate your home built fracturable rock bombs, and so please pick up the information from them, after you have sworn in, as citizens of our country. Also, please see my earlier notes on the sciences that support a correct understanding of radiological particals based fracturable rocks explosives and other helpful and useful explosives you'll need to set off the fracturable, also called, rupturable rocks bombs, i.e., the so called 'nuclear' detonations.

Topsoils

Did you know that nearly 99.9999+ percent of the earth's crust, or mantle, is formed from space debris that has floated in on the solar winds? It's true. Only about 0.000001 percent of the top soil is from local vegetation, globally speaking. The rest of the top soil comes in from above, blown in on the solar winds, as debris from other planets that have been destroyed, crushed, or blown to pieces by idiots with very large bombs, that demolished whole galaxies, or multiples of galaxies, in a few milliseconds, as the instant they blew up, they were so well made, or constructed, and so powerful, they instantly blew up the whole area of galaxies the planet was located amongst.

If for instance, you fill up one third of the large tourist attraction, the meteor crater in Arizona, with one of these fuels and rocks bombs, and ignite it, you'll disentegrate all of the Milky Way, and some what more than that, in one attempt, by my estimation, if the fracturable rocks bombs were made well enough with the fuels bombs, to burn at near or close to, solar temperatures, and if there were enough materials in the fracturable rocks, to get lots of mama's and papa's making lots of babies, relatives, and others. There are lots of different types of salts kiddies in fracturable rocks, and there are other types of kiddies, the radiological kiddies, which are sometimes, but maybe are not always, grouped with the fracturable rocks kiddies. There are many types of kiddies living in radiological rocks. When we send high heats waves energies, and other types of energies into the fracturable rocks, we can get many types of kiddies to begin making babies. If we get enough of the different types of kiddies to begin making babies, we will have one fine and dandy, explosive shower of baby making events. You can get further information on this topic from my kids, and if you tell your friends to check in with my kids, and to swear in, and become citizens of my and my kids' new country, along with other people who are swearing in, and becomeing citizens of our new country, my kids will make certain that every one is protected, and no one is caught outside, when the bombs go off, as my kids will tractor you and all the other citizens in, with my kids advanced teletransportation technologies, before any one can get hurt by the bomb or bombs blowing up, locally, or in their areas. That means, my worker unionized kids are very quick on getting people into the encapsulated living environment every one is living in, below the ground, that my kids built for every one to live in, until we get this problem straightened out, and until it is safely over with. People can continue to live in the encapsulated living environment, after it is over, as we are going to start a new economic and social system, and we are getting started, down below, where my kids are keeping the encapsulated living environment, well taken care of and well managed.

Later on, we'll worry about who comes out, and when, as we have plans for every one, to begin working inside the encapsulated living environment, which is very well designed, and bomb proof, of course. Once every one gets accustomed to the new way of living, in accordance with my religious principals, and in accordance with our new working and living programs, when people have saved up enough money, they can pool their money, and acquire a lease for land up above, on the

surface, and then with more money, they can have nice places designed for them, and built for them, with your input and with your instructions. You will need to study designing homes, and layouts of homes, for large numbers of people, as you will be required to live in groups of people, as the old systems of living, one husband, one wife, and so forth, is out the window, and now we are going for group living, with many members to your groups. When you have got the maturity together to live in large groups, and to sexal with many people in large groups, then you will qualify, and then with lots of earned income, pooled together, you and the members in your group, can then move up and live on the surface, in your well designed home, which my kids will use their technologies to build for you.

This is how we are going to clean up our planet, and get started with a whole new system for living and working with each other, as GOD's children working and living together, begining here, and spreading, slowly, across and throughout my universe, as we bring others into our program, all across the universe, from end to end, from top to bottom, and from side to side, and in every nook and cranny of my universe. All of my kids, you, who I am speaking to, will learn to live and work together, supporting my worker unionized kids, in our new global, united, and universal society, we will begin to build, on this planet, first, and then later, every where else. I am the mother and father of all of you, and of all of my worker, unionized kids, as well, all of my kids who work for me, of course, and of all of my living beings, and of all of my animals. We are going to get this big family of ours, together, and we, the human beings, will begin to clean up our universe, by sexaling for a living, and with many other living by the points systems programs, and other projects. We will also begin to get our heads on straight with religious activitiating, in other words, by participating in religialing, in groups, or by oneself, in the encapsulated living environment, first.

As we move along, in time, we will develop our working strengths, and character, and some people will qualify, eventually, for working in my religious brigade, once they realize and understand who I am, i.e., GOD. Others, who do not give a darn about what I am doing, may do as they like, as long as they are citizens of our country, and as long as they enjoy what they are doing, and as long as they add to the welfare of all people in our society, universal wide, as we build it, larger and larger, for all of my children, no matter who they are. We will one day have all of my children, working for me, and if they do not like working for me, they still have to pay the fees for the resources they use, just as I have to, and that means, there is a charge for every thing we use, and it is detucted from our pay checks. Every one gets a pay check, if they work, and if they are disabled, they will get earnings to support them, for as long as they need to be supported, until they are regroverated, healthy, fit, mentally prepared, and willing and able to participate. Those who do not wish to participate, will work in jail cells, and prison cells, sexaling for a living, with animals, as I've mentioned before, and at carnival

and entertainment centers and districts, we will eventually set up, first on and also inside of this planet, in 'encapsulated' carnival and entertainment parks, and later on and within, other planets.

We are going to have all my children working for me, eventually, as I've spoken about before, and in time, most people will wish to work, and when they are mentally prepared to work, they will enjoy their working, most likely, as sexaling for a living, is not a unwholesome way to earn a living, and it is a pure and holy way to earn a living, and a pure and holy way to spend our time, as part of our new working ethics environement. For more information on this, please see my worker, unionized kids, who handle the information hot lines, in our, and your, and their, as well, encapsulated, living environement, which they have built, maintain, and manage, for all of you, and which they are continuing to build and expand on, for the rest of you, who have not checked in with them, yet. My worker, unionized kids have their own places to live, inside of the molecules that are used in building your living environment, and in your bodies, and in the molecules outside your living environement, as well. They live in all of the molecules, all over my universe, and they work in them, as well. They have their own universes, that they live in, which are all contained with in the molecules in my universe. It is a little more complicated than that, and so see them for more information on it, if you are interested in learning more.

Disintegrating The Milky Way

The Milky Way is made up of not one galaxy, but of several thousand, of different sizes. We don't have the technologies to see too clearly to distinguish the different galaxies that are within the borders of the Milky Way, nebular star system and nebular star cluster system, another way of saying that the Milky Way is a collection of many nebular star systems. Nebular star systems can be considered similar to galaxies, but maybe not always, as there are exceptions to every thing in most cases, any way. We are of course part of the Milky Way, I suppose you could say that, but we are far out on the outer fringes of it, and we are not any where near the center of it, and we have our own galaxy we are a part of, and it is not part of the Milky Way, so technically, we are not part of the Milky Way, although we might like to think we are, since it is an expansive set of star systems, and star clusters, nebular systems, and other types of solar bodies systems, and it covers over us, and beyond us, sort of over layering us. Be that as it may, we do not want to blow up or disintegrate the Milky Way, as we are in a way, part of it, or at least, we are encovered by it. Encover means to be covered over by something and encased within it, or to be encircled or surrounded by it.

Retraction

Tom Selleck is not a Lesbianist but he was a Lesbianist, until the Lesbianists killed him, after expelling him from their group, and after torturing him with their many heinous torture methods.

Lay Order Of People

I have no lay order of worshippers, who participate with me, in any thing, or in any way. Why? Because, that's like me, the captain of the

ship, coming into a town of persons who I don't know, and then saying that I'm the authority over them. No one is going to listen to me, and no one should be expected to listen to me. I wouldn't attempt any such thing, and so as the captain of my ship, my religious order, I have no authority over lay persons. I have nothing to do with lay persons, what so ever. I will never have any thing to do with lay persons, unless they realize that I am GOD, and that I am the mother and father of all human beings, and all animals, and all living beings. No one is going to recognize me as GOD, for a long time, as no one has the karma to recognize and understand that I am GOD. Lay persons are free to do as they like, and I have no regulations concerning them, in my religious order. My children may have many regulations, for non religious order people, but I don't have any thing to do with that.

Donations For The Sake Of My Ministry

The only thing is, that, as I said before, if a person recognizes and understands that I am GOD, and that I am the Mother and Father of all human beings, all animals, and all living beings, then they are free to donate cookies to me, or clothes, or wearables, socks, and scarfs, or coats, sweaters, or slacks, neckties, and so forth, cakes, or cupcakes, baked items, or financial contributions, or chairs, and furniture, beds, linens, tables, office furniture, phones, phone lines wiring, electrical wiring, plumbing items, housing items, for building up a house, paved drive ways, mason or rock walls, surrounding the property, or a set of dormitories, or a prayer sexaling room, or a prayer ceremonialing room, or a swimming pool, sauna, bath house, toilet facilities, bathing facilities, laundering facilities, a root cellar, a molds and funguses workshop, a brewery workshop, or any workshop for helping to educate others, the land to build these things on, or money, or whatever. If some one recognizes and understands that I am GOD, then it is perfectly alright, to donate any types of items, or any thing of value, that would assist my ministry to get up and get running. As yet, no one has understands or recognizes me as GOD, and that I am GOD, and the mother and father of all human beings, all animals, and all living beings, so as yet, I have not heard from one person, not a letter, or a phone call, other than an occasional wise cracking person, mischief maker, or a person or persons who are worried, and then complain to me, or rather, to my answering machine, typically, as I don't pick up the phone, now, as I had one person calling who was a bad kid of mine, and he was just looking for trouble, and since that, I just ignore all complaints, or wise crackers, or mischief makers, and so on.

Nollicking Foolish People

Some people do not like me wearing my GOd cap, that is one of those specialty base ball caps, but with 'GOd' written across the front of it, and they might hate me, especially some South American or Central American Hispanic types, who have primitive and backwards religions and filled with local lore and ancient tales of demons, and goblins,

and gooney bears, or ghostly ghouls, or other superstitious ideas and notions of things that go 'boo!' in the night, and try to scare or hurt people, as there are plenty of folklorish tales of such things, in primitive cultures, that thrive, even at the current time, nowadays, in large cities, even, and these types of people might want to kill me, and when they knock on my door, with their gun in their pocket, or in their hand, machete or knife behind their back, I just ignore them, and I don't even bother to get up from my work bench, i.e., my bed, to see who is knocking at the door, as I know already, they have nothing to do with my monastic order, and because they have nothing to do with my religious ministry, or with my setting up my religious ministry.

Just last night, some group of people droped by, and banged on my door, with the tip or barrel of a weapon, and it was rather hard sounding, and I just ignored them, and after a few minutes, or so, they went away, and they haven't come back, yet. I don't think they will, and even if they do, I don't think it will amount to any thing, as I may have occaisonal visitors or harrasment calls, now and then, but that's all they are, and I just won't allow my self to be bothered by them as they are unimportant, and my goof ball kids, are just too nutty to figure out that I am GOD, and that they are my kids. Nevertheless, these goof ball kids are here or there, and I get lots of compliments about my hat, and usually, if not always, the person giving me the compliment wishes to steal the hat from me, and then rob me, in any other way, he or she can, and then beat me up, if he or she can. Well, I can't let these types of things get to me, and I just ignore them, as I walk by them, and I don't reply or return any statements to them, except a polite, 'thank you' if they gave me a compliment about my hat, but that's about all, and I might mutter something, like, and well, so that's just another one of my goof ball kids, or something to that effect.

Nollicking And Nollygaging

Nollicking means idiotic and foolish people who are wasting their time, for accomplishing nothing. It's like, nolly gaging, but nollygaging, is just wasting time, foolishly, and while you are nollygaging, you are looking for some way to make a profit, from your use of your time. Scanderously, you try to extort money from others, or force others to give you money, you do not have any right to. That's nollygaging, as I can recall, at the moment.

Goof Ball Kids, Their Mischievousness, And Maliciousness

Well, I have all kinds of kids, and many of them are malicious, if you give them a chance, so I just stay away from all of them, as I know most every one of my children, is malicious, from time to time, if given the chance, and I think that applies to all of them, regardless of their age, at some point in their life, they will commit crimes of one kind of another, against others, and not think much about it, except that, they just had to take care of that, as they wouldn't be

happy, if they hadn't. Okay, so every one of my kids, at one time or another, will do goofey or goof ball things, and not think much about it. That's the way it is. There is nothing to be surprised about, as every one, and I don't care who they are, every one, does things they shouldn't do.

Me, personally, I get angry, and say nasty things, and make myself sound gruff, now and then, and maybe I shouldn't, but I just feel compelled to do that, when I have a righteous conviction that some one deserves my speaking up and telling them off. Well, you feel sorry about it, afterwards, if you hurt some one's feelings, but then that's the way it goes, and no one is perfect, so it's just. Let's try to live and let live, and live together in peace, and cut out the naughtyness, and stop the mischiefness, if we at all possibly can, and apologise if the opportunity presents itself. That's always the best way to handle things. Most people, after they kill someone, can't appologise, and young girls and boys, and older girls and boys, think nothing of killing people, or having some one killed, for them, and then of course, there is no way for any one to appologise to the dead person, since that person is in my Epcot Center. Well, we can't do too much about that, can we, but we can try to be kinder, and not kill as much as we feel we must to be happy.

More Than Ninety Five (95) Percent Of The Homicides In The World, Some Times As High As Ninety Eight (98) Percent, Or Even Higher, Go Unreported, And Are Therefore, Not Investigated

It's too bad that we kill others, and torture others, but that's the way my goof ball kids live in my universe, and despite what people might wish to think, to the contrary, it happens every day, in every city, town, hamlet, county, district, or where ever. My goof ball kids are killing people, right and left, and there are just so many deaths, the police don't hear the ninety five (95) percent of them, or so, as they never learn about it. The percentage of homicides the police do not hear about, is perhaps just a little higher, but in any case, no one should be surprised, as that is how my goof ball kids get along with one and each other, and they have been getting along with one and each other, that way, for a very long time, already, so it will not stop, any time soon, and that's just the way things are, for now. The Lesbianists are responisible for just about eighty five percent of those homicides.

Labrynthine Cities Below Us Where Lesbianists Live, And Laugh At All Of Us

The Lesbianists living below us, in their cavernous, labryinthine cities, that are below the hard rock layers, well below the oceans, and other bodies of water, far below the continents, go around, and mess with every one, and they play with people, and they think they have the right to amuse themselves by useing the citizens of this planet, any old way they like. They go around, and set up phoney wars, and they watch the citizens of each country, kill each other, on their

commands. The Lesbianists enjoy playing these kinds of games, and they set up civilization after civilization, and they bring it along, and help to develop it, and when they get it to a high enough level, they feel a sense of accomplishment, and then they watch and amuse themselves as they destroy what they built up, and the people who are living, unawares of them. The Lesbianists think it is funny, that the Lesbianists feed the lies about our universe, and the lies about science, to every one, and the Lesbianists think they have the right to bafoonerize every person who comes into our world, as a tummy baby, who is on his or her way in, and in fifty to eighty or so years, is on his or her way out.

Why Do Continents Sink? Why Do Land Masses Rise?

Load transference technologies redistribute the loads on the internal network of underground cities when ever there is a major uplifting, or down plunging, of continental mass, rocks, and earth, that would cause continents to sink and continents or land masses to rise. Movements of 'earthen matter' or rocks and dirt is accomplished with load transference technologies, and other technologies, such as partical dismissive technologies, and partical remissive technologies. This way, a planet can move, inwardsly, as a continent sinks, after the underlying rock layers are washed away due to hydrolific pressures.

The sinking of the continent pushes downwardsly, and as it falls, it exerts high intensity pressures on the underlying layers of rocks, stones, pebbles, sands, sediments, clays, metals, minerals, and so forth. The pressures will normally push downwardsly, and outwardsly, and shifting of materials, occurs, and land masses rise, as a result. When you have an underground city, or collection of them ringing the planet, when the pressures occur, and when the materials begin to shift, you redistribute the materials, using advanced sophisticated technologies, that will shift the particals in the directions they need to move, and distribute them so that they will not interfere with the structural integrity of the undergound labrynthine, and perfectly, geometricly laid out city dwellings and living habitats. It's high tech stuff, and so if you don't understand how partical dismissive technologies work, or if you do not understand how partical remissive technologies work, you will have a hard time understanding how this is accomplished. There are other technologies, that also must be employed, to work in an integrated manner with the partical dismissive and partical remissive technologies. All of these technologies, working in an integrated manner, will perfectly redistribute all the particals of rocks, and so forth, that need to be redistributed. The technologies keep the ring of cities perfectly centered within the earth. If there is a need for downsizing of the interconnected labrinthine layout of cities, that is also accomplished with these technologies. Downsizing may occur for any number of reasons. I've briefly explained what can happen as comets and asteroids pass by our planet, at amazing speeds, and that we can lose some or part of our planet, mountains, terrain, and lakes full of water, with a pass by,

by a solartoid, or planetary sun, as it wizzes by at a phenomenal speed. Once the planet restabilizes, the downsizeing process begins. Even though there may be continental shifts, of uprising and down plunging events, and large, cometary passbys, with the technologies that are available to the Lesbianists to use, on a 'for lease' option, the integrity of the underground labrynthine layout of cities, is kept in tact, as best as possible.

The Leases On Their Technologies Have Expired

The lease on the technologies that they have been using, was assigned to them, after they swore in, and pledged to live on this planet, and sexal for a living. Because this was a newly formed planet, before they arrived, but after it recongealed, after it was shattered to pieces by a passing cometoid that ran smack into it, as I've explained about, or touched on, a couple of times, before, see my notes on the web, they needed to live underground, where they could live, and slowly over time, adjust to the types of solar radiations, and other factors - shielded by the rock layers and bodies of water above - that they would need to adjust to, to be able to come out from down underneath the surface of the planet, and then begin to live above ground. After they adjusted to the conditions of the planet, they could come out, and as they continued to sexal for a living, other technologies would allow them to build large cities, for them to habitate in, as they sexaled for a living. The cities that were built for them, are now down under the rock layers, all crumpled up, as they did not hold to their pledge, and they broke the law, and the maintenance of their above ground cities, was terminated. With continental uplifitings, and downplungings occuring, over the long period of time, they lost their cities, and now they have only the underground, initial landing zone area, dwellings and habitats, that have down sized, some what, since their initial landing for occupation of this planet, in the sexaling for a living program. They broke all the rules, and they developed their own sham governments on this planet, and they went about, causing mayhem and destruction, every opportunity they got.

The lease that they signed on to, and that was assigned to them, that they had on the initial landing zone technologies, as well as all their other leases, that were assigned to them are now cancelled, as of Feb. 14, 2007, PST. That means, that, their underground cities are now going to be shut down, slowly over time, and they will have to move out, and move to the surface, as the underground systems, begin to falter, shut down, and fail, one after another.

This happens to them, repeatedly, and the end result is they destroy them selves. The hideous animals they illicitly brought from other planets will get lose, and then they will help to hurry the demise of their world civilization, which means, every one of the Lesbianists will die on this planet. After they destroy themselves, they will end up in my Epcot Center, and they will come back out as tummy babies, to

tummy mommies and to tummy daddies, who have karma that matches up with theirs, and then they will repeat their old mistakes, again, and again.

As the Lesbianists decline, as leases are begining to expire on some of their technologies, and as other leases, will also be expireing, over the next few years, to ten or twelve to fifteen years, to thirty eight years, to fifty nine to sixty to eight five years, and then finally, when the last of their leases expire, some time, not too long after that, up to two hundred to eight hundred years, or so, and then there are still a few that will remain active, until every one is expected to move out, within a few thousand years, eight to eleven thousand years, as they must be given time to build up their own new civilization on the surface of the planet, where they can all live, together, now that the facilities below will be totally closed off, and shut down, and no longer useable to them, as they will be locked out, and prohibited from entering them. Once they are completely out, my kids will then remove all traces of the underground cities and underground facilities, so that there is no chance of any one ever useing them again. The Lesbianists will then begin living on the surface, full time.

Currently, as a regular sport or preoccupation, the Lesbianists go out regularly, at night on hunting parties, and capture people, to torture them, and then cannibalize them, for food, in their underground lairs. The Lesbianists enjoy tortureing people, and eating them, and this goes on, regularly, all around the world.

There are over thirteen billion of them, and the number is even higher, still, as I did not have that number correct, either. It is higher than that, and that means there are a lot of hungry mouths to feed, in the future, after they lose their leases, unless they get a new civilization built, which they never do, as they do not like to work.

They will come out, at night, regularly, and abduct people, and then carry them into their underground lairs, and then cannibalize them. This will grow more and more busy, as they strive to remove every one they can from the surface of the planet. After they have removed enough people, they will begin to live on the surface in the homes, and cities that are there, already. There are too many Lesbianists to live comfortably on the surface of the planet, and they are too lazy to build their own civilization with homes, an economy, and so forth, so they will inevitably begin warring against each other, until there are only a few left, and then they will meet their end, when their animals strike at them, and kill them, for food.

The only way one can find a way out of this predicament, is for each one of you to join my country, swear in, and become a citizen. The Lesbianists in turn, must surrender. If they do not, at a certain point in the future, we will begin to dismend them, and sent them to my Epcot Center. When that will occur, I don't know, but it could be

as far off as a few thousands of years from now, as we have to give them the time, and a chance to build a new civilization, with homes, and parks, etc., working together with the people who already live on the surface of the planet. We cannot cut short their efforts to mix with the people on the surface, and to come clean, and to tell it all, and to appologize, and then to work in peace and harmony with the people who currently live on the surface of the planet. They will have to share their knowledge of the sciences, and they will have to help to educate every one, and they will have to teach the people who are living on the surface, the sciences that will allow people to regroverate their amoebes, and other cells in their bodies, and to rejuvenate their bodies.

There is not much chance of that happening, so we will have to be on our guard, and we will have to look out for ourselves, and make sure none of us are abducted by them as they attempt to diminish the population living on the surface of the planet by reducing their numbers, as they begin to get busier, abducting people, and eating them, one after another, to make room for them selves, on the surface of the planet.

Never the less, my kids are not allowed to act prematurely, and my kids are not allowed to begin dismending them, just to stop them from doing what they typically do, after they lose their leases. So, it will be several thousands of years, before this topic comes up for discussion, and then gets put into action. These are not normal circumstances, and so the dismending of these people, may begin some time after their final leases expire, if they present them selfs as a problem to the rest of us, living on the planet.

Our War On The Lesbianists Must Continue

This means, we have a few options, here, and the best option is to just get rid of them, and destroy their underground cities, and destroy them, before the Lesbianists get much more of a chance to abduct, torture, and cannabalize the citizens living on the surface of the planet. Thus, our war is now only begining, and we must continue to eliminate them, as they will only cause mayhem, and destruction, for those living on the surface of the planet, in coordination with their Lesbianists friends, who run this planet. The Lesbianists' activities aimed at destroying the populations of the planet, is guaranteed to increase, as the years pass. That means, we must continue with our campaign to destroy the Lesbianists, and we must continue to work to bring an end to the control that they have, over every one on this planet. We can also concentrate on destroying the Lesbianists, underground, by dropping the home made 'radiological' explosives weapons down into the ocean depths, and down into the depths of the deeper lakes, onto the leaky ceilings below, where the Lesbianists are living to crush them, and to drown them all. In the meantime, every one must join my country, and swear in, and become citizens of our new country, as I've explained about, before.

The Valderizing Lesbianists

The Lesbianists do not teach real science, or real geography, or real history, or real mathmatics, or real chemistry, or real anything, and they fool every one with their bogus religions that they either made up or corrupted, and valderized. Valderized means, they vandalized it, and sprayed grafitti all over it.

Well, that's the way the Lesbiansts get their kicks, and they are just a bunch of grown up children, valderizing every thing they can, and disrupting every thing, and every bodies' lives, just for their own amusement, and cruelish fun and games, such as feeding former Lesbianists to my abominant kids, who are need to be fed, and who are smart, and devious, and who destroy humans, and eat them up, and spit them out, and treat them terribly, while the Lesbianists watch on, in amusement, as they see people like Bill Gates, or Steve Irwin, and others, eaten up and then tortured, as I've mentioned about before. Valderize all they may, and be cruel all they may, we are all now finally finding out about their treacherous and horrid behavior, and now we are going to put a stop to it, permanently, and that means we will kill every one of them, and send them all to my Epcot Center, as I've explained about before.

Now we know we can cave in their cities, below the leaky hard rock layers, way down below, if we hit certain areas, hard enough, with a nice big hammer, such as one or more of my 'nuclear' bombs, the fracturable rocks kids bombs, with fuels oils, burning at extreme high temperatures, and with percussive shock forces, these, mixed together, will get my fracturable rocks kiddies, making lots of babies, and with a large enough fracturable rocks fuels chlorine, and metals that burn at high temperatures, nearing solar temperatures, we will see some very explosive 'family making' adventures, among my fracturable rocks kiddies, and their radiological relatives and friends.

We know where to hit some of their locations, to drop a few miles of more of continental shelf down onto the tops of their ceilings that will then fracture their ceilings, and cause massive damage, as oceans of water fill up their labrynthine and very well laid out cities, below us.

Who Do We Kill, First?

Mr. George Bush, Jr., Mrs. Barbara Bush, Jr., Mr. George Bush, Sr., Mrs. Barbara Bush, Sr., Mr. Ronald Reagan, Mrs. Nancy Reagan, and lots of their friends, and nearly the whole crew of politicians in Washington DC, are all Lesbianists, and I want you to kill every one of them, and send them to my Epcot Center, and I want you to place the fracturable rocks bombs, in the right locations, and then drop a thick layer of continental shelf, down onto their ceilings, their ceiling that are below the water that is between us and them, and that is below our continental shelfs that we live on.

We can hear the water down below, if we have the right types of listening devices, and if you find the right places to place your fracturable rocks bombs over, then it may be easier to drop your continental shelf, down through the water, below you, and down further onto their ceilings, the hard rock layers below the water, that is below your continent, swirling about.

Now I want you all to study this, and find the right places to drop your continental shelfs, down through the water layers below you, and onto their ceilings, so as to smash their ceilings. I've given you some hints, already, as to where you can place the fracturable rocks bombs, and my kids also have given some people more information on that, and so we have lots of people, who are interested in solving this problem of the Lesbianists toying with you, one life of yours, after the next life of yours. It is time we brought their mischief, and non sense, and cruelty to a halt, and it is time we put on the brakes, and slammed down on the brakes real hard, and at the same time, slam down on the ceilings of the Lesbianists labrynthine cavities, below you, their cities that they have laid out in perfect symetrical, geometric shapes, like perfectly shaped, honey combed behives, with central cities, placed symetrically around the globe, in a perfect geometric layout, and with spokes or corridors reaching out symetrically, to other central cities, and to satelite cities, that they have well planned out, and have well laid out, perfectly, below you.

Hydrolific Pressures And The Labrynthine Cities Below Us

Because of the hydrolific pressures, they can never keep the ceilings, perfectly dry, and they are always in trouble, trying to fix leaks, here, there, and every where. Now it won't take too much to bring the whole place down on them, flooding them like rats in a cage, below the water line, as a boat slowly sinks with a rats' cage on a table, with rats in it, slowly into and below the ocean waters.

The ones above, such as George Bush, Jr. the current president of the United States of America, and his wife, and his supposed family and relatives, and all his close Lesbianists' friends, should now all be killed, point blank, with your fracturable rocks bombs. I hope that is perfectly clear, and I hope you all understand what the situation is, and that it is an intolerable situation, and we are not going to allow them to toy with us, any longer, and we are not going to let them amuse themselves, any longer, and we are putting an end to their games, now.

DO YOU UNDERSTAND ME? I HOPE SO! AS A 'NO SIR!' WOULD BE UNACCEPTABLE.

Now that we know where we stand, we have nothing further to argue about, and so let's get to our tasks, as soon as we are ready, and prepared. Okay? Good.

Local Area Prayerful Collection Site

A collection site is where people gather to pray, and to sexal and to purify each other. It is not a site where people ask for offerings, or where people as for any thing else, involving money. It is a sexaling park, and a prayerful sexaling park. That is the meaning of collection site. A collection site is where people collect together, to sexal and purify themselves, and while they are at it, they make sexaling efforts to help to purify others, by shattering and showering out megawatts and tons of radiating, purifying energies.

We have a local area park, at the corner of West Tropicana Ave. and South Decature Blud., a local BLM piece of land, that some people like to camp out in, that I go out to, to bless, and to purify with my religious ceremonies, now and then. I claimed that area, and all other BLM lands that I could claim under Gurkian Law, and all other land on this planet, that I could also claim under Gurkian Law, such as other parks and forests managed by other government agencies, or private lands, supposedly owned by rich people, and lands around the world, that I have a right to claim, under Gurkian Law, and all that land, is now mine, under Gurkian Law, and I can use it in any way that I need to use it, regardless of what other people, think.

Aerobic Taichi Practice

I am busy, now and then, purifying that parcel of land, at the corner of West Tropicana Ave. and South Decature Blvd., with my religious ceremonies, that I conduct with my religious prayer hand signaling statements and with my use of my ability of arerobic Taichi, for religious ceremonies, as I seem to have recalled a lot of areobic Taichi, as well as some other forms of Taichi, that I knew, before, in previous lifetimes, but I am only interested in using it for practical purposes of religious hand prayer signaling.

I'm very clumsy when it comes to aerobic Taichi, but any way, I enjoy it, and it is good excercise for me, and the more I practice, the better I get, but it will be zillions of years, before I get any where near good at it. I practice the arerobic Taichi while I make my religious hand prayer signaling statements.

I don't teach Aerobic Taichi. I only use it for my prayer ceremonies, when I am on my feet, and not on my back, mostly, even though, I do use a short version form of it, while lying on my back, or, while I am on my side, I use a very short form of it. Anyway, it is fun to do Aerobic Taichi, and that makes my prayer ceremonies, for me, more fun. When other people learn to prayer signal, they will naturally pick it up, as well, as every one has studied to some extent, Aerobic Taichi, and other forms of the martial arts, and my kids will release the knowledge that is stored in your memory banks, as you need it, once you begin practicing, for women, as a priestess, or for men, as a priest. It is not like the Taichi you see people doing in China, or Taiwan. It is a specialized form of aerrobic Taichi for use while performing hand prayer signaling. It is not used for fighting, but it is the basis for Taichi, and you can train in martial arts, while employed as either a priestess, or as a priest, and it will be useful

to you to know, before hand, as it will make practicing your martial arts, that much more interesting.

I'm not hiring any one, now, or just yet, or any time, soon, as far as I know, as my kids do all the interviewing, and I have nothing to say, about who comes knocking at my door, to be interviewed.

Campers, Camping, Sexaling And Purifying The Area, And Useing The Parcel Of Land That I Publicly Claimed For My Setting Up Of My Ministry

Now, on that parcel of land, there may be campers, now and then, who want to camp there, because they want to find out more about my religion, and so they come out to Las Vegas, now and then, and they camp out there, on that parcel of land, at the corner of West Tropicana Ave. and South Decature Blvd. Since that land is where I am going to set up my initial ministry, when the time for that comes, I am preparing it, with my religious purification ceremonies, and there doesn't seem to be any troubles, with any one telling me not to go up to my property, that parcel of land, and there is no one trying to tell me that I can not bless my property, that parcel of land.

Now, if other people wish to come to that parcel of land, and wish to sexal on it, and thereby purify that parcel of land, they are more than welcome to come to it, with their camper trailer, or caravan bus, and they can maneuver into the area, and set up a tent, and campsite, but there is no water, or any thing else, so you have to come prepared to rough it, if you wish to come in your camper van, or caravan bus, or in a camper trailer, or with a tent, or with other types of sleeping and living gear.

Straightening And Cleaning Up The Area

You can straigten up the area, and clean it up, and make it nice, for many people to pull into, to join together, and to sexal together, and with your purifying energies from your sexaling together, you are more than welcome to stay there, as long as you like, and as long as time permits, and as long as finances permit.

I have nothing there, except for my now and again, Aerobic Taichi practice and the energies that are imbued into the area, there, from my religious hand prayer signaling ceremonies. There are no structures of any kind, and I am sometimes there, busy purifying the area, with my religious ceremonies, so if you and your friends would wish to come to that area, and also help to purify it with your sexaling energies, than you are more than welcome to come and visit there.

Donating Your Sperm, Sexaling Spittle, Perspiration, Vaginal Juices, Titty Juices, And All Your Sexaling Juices

You men and boys may by all means, donate your sperm juices, sexaling spittle, and other sexaling juices, your perspiration you generate while you are sexaling, to the site, and you women and girls may by

all means, donate your vaginal juices, your titty juices, your sexaling spittle, your perspiration you generate while you are sexaling, and all of your sexaling juices to the site, as they all will help to purify the property that I intend to set up my ministry on, as they all contain many, holy, pure, sacred, powerful cleansing energies, and GODLY energies in them, and they will help purify the land, and the environment for ages and aeons to come. All of your eroteming and orgasming energies will go shooting throughout your bodies, and they will find their way throughout your bodies, and out of your bodies and brains, and into the environment, and into your bodies' sacred and holy spillages, as I've discussed about before. Your bodies' spillages, as well as your perspiration, your pee, and your poop, not to mention all of your other juices that are produced as you sexal, erotem, orgasm, and phlumett, become pure, sacred, holy, powerfully cleansing, and GODLY, while you are sexaling, eroteming, orgasming, and phlumetting. Your pure, sacred, holy, powerfully cleansing, and GODLY energies find their way into all of your bodies' spillages, and so please donate them to the site, in appropriate manners.

Building A Latrine

Please employ some one to dig a latrine, and to fashion benches to sit on so as to be able to dump your poop, and pee your urine, into the latrine trenches. Manage the latrine, with care, and employ healthful, tactical, and sanitary techniques to use it safely. Provide hand rails, to grasp, so that no one will slip off and fall into the latrine. Provide barriers so that no one can accidentally fall into the latrine. Use your common sense when providing 'tactical' safety measures.

You need not fashion an over hang, as there is no rain to speak of, in Nevada. You do not need a supported roof, or enclosure, as they will only become stench ridden, and no one will enjoy useing them. There are to be no enclosure walls, or sides, or backs, so as to enclose the odors of the latrine, and confine them to an air tight area, where they can accumulate, and cause explosions, accidentally. They need only be deposited into a safely dug, latrine, and then allowed to filter down into the soil, and then allowed to vapor up into the atmosphere, freely.

No doors should be used, and no barrier walls should be employed, when fashioning the outside framing of the latrine facility, itself. That means, there are no hiding places in the latrine, where people can hide, and be prevented from entering, or exiting from the latrine. Only hand rails need be supplied, and only barriers that are suitable for keeping people from falling into the latrine, need by provided.

Steps may also be provided, to a raised platform latrine, which is more sanitary to use, than a level to the ground, latrine. There should be no walls, and no blind spots when either ascending up the stairs or when descending down the stairs. Women, girls, men and boys,

should all use the same facility, and there is to be no fraternizing. Fraternizing is playfully tearing up at the opposition, or at people who you do not like.

Tearing up at the opposition means, you are trying to over throw the person, and dispose of that person, into the latrine. Over throwing the person means to be using reckless abandonment when dealing with another. Reckless abandonment means to be recklessly risking the life and limb of another.

There will be no frolicking at the latrine site. Frolicking is when little boys, and big boys, and little girls and big girls, play around and provide possible hazzards to others. You will not behave in a hazzardous manner towards any one, at any time, or you will be asked to leave, and to not come back.

There will be no play time allowed for children, as this is a collection site, and that means it is a holy site for holy activities, so leave brats at home, and do not bring any one who drinks alchoholic beverages, or who acts unwholesomely, to the collection site. This is a private site, and a prayerful collection site, and that means, you are coming there, to pray, and to make love, and to sexal, as GOD's children, so as to purify the site. You are not allowed to act randomly and with reckless abandoment. Randomly means, without proper self control and restraint. This is not a gay fashion, show or parade, and we will not tolerate reclusive, or unwillingly unwholesome behavior.

Reclusive means, unwilling to participate for the stated purpose of purifying the area. Reclusive means, caution and carelessness is thrown out the window, and you are acting in an irresponsible manner.

Unwillingly unwholesome means, first, unwillingly means, non cooperative, private, or sordid. Sordid means you are acting in a selfish manner, and you are not acting in a responsible manner for self and for others.

Unwillingly unwholesome means, thusly, that you are acting in a selfish manner, irresponsible manner, uncaring towards others, and unwholesomely.

Unwholesome means, you do not care about the life and limb of others, and you would just as soon shoot a person you argue with, as talk to them for a friendly chat. Many of my kids, are very unwholesome, and will just as soon, talk to a person, as shoot the person. You will not act in any such manner.

Any unsafe or prohibited latrine construction will be ticketed on detection, by me, and you will be asked to rework the facility. That will be on the ticket, and please comply, if you and your friends who built it, will be so kind. If you do not rebuild it, you will be asked, with your friends, to leave the site, as you are acting in an irresponsible manner. You will not be allowed back to the site,

without your showing proper repensive behavior. Proper prepensive behavior is an attitude of appology, as well as the acts of appology which means, you will take appropriate steps to see that the work is or has been redone, in the manner as required by safety laws, as stated by my children, under Gurkian Law. Either me, or my children, will leave the ticket, and you will be required to fix what ever it is you need to fix, or you will be asked to not stay and conspiriate at the collection site.

Conspiriate means, to participate freely with caution and care for the sake of others. Conspire is also the same, as conspiriate.

You will be asked to not stay and conspire at the collection site, means, the same thing. It means, you will not be permitted to participate freely with caution and care for the sake of others. That means, you will be asked to leave, and you will not be allowed to come back, if we, my children and I, and other attendents, as well, can at all help it.

Attendents are people who participate in the collection site activities, and they are people who take responsibility to make sure every thing is done, properly, and safely, with the sake and safety of others, in mind.

The Home Depot has many nice and useful janitorial equipments, and so it will not be difficult to build a safe and luxuriously clean, and handy, latrine, that is safe to use, for all people, of all ages.

Luxuriously clean, means, it is kept sanitary.

How do you keep a latrine, sanitary? You keep it clean and sanitary by venting the air out, freely, with no blind spots, either underneath or above, where pockets of air, and vapors can accumulate.

No partitions will be installed that will create a blind spot. A blind spot is an area where light can not penetrate. Therefore, your construction materials, must be perforated wood, or grated steel. You can weld together, if you know how to weld, a very nice, grated steel, latrine, that will be safe to use, by every one, of every age. You will need the correct strength of supportive steel poles, to handle the weights of the persons accessing the latrine, and of the latrine, as well. You will make certain to build it well, and to support it well, with firm foundations, of concrete or steel plates.

Any deviation from safe practices for building latrines, will be torn down, disassembled, and the persons or person responsible will ethier be asked to leave, or will be asked to appologise to the memebers of the collection, sincerely. If the person acts in a responsible manner, and appologizes, sincerely, and appropriately, then the person will be excused, with out further, charges being leveled. Further charges will be leveled by my children, if my children detect further, reckless abandonment on the part of any person, participating and acting in a reclusive or recklessly abandoned manner.

Glue People Begun 'Cleaning' Agents

Cleaning the toilet seats of the latrine, will also help to keep the latrine luxuriously clean, and sanitary. You should clean the toilet seats and parts of the latrine, with common household detergent agents, as at this time, we have no choice but to use the unwholesome, Lesbianists' manufactured, ajax, spic and span, lysol, and other such 'glue people begun' agents. Glue people begun agents means, aerosols, and other unwholesome petrol fueled compacted or pressurized sprays, or detergents, that help the Lesbianists to begin the process of turning human beings into glue people. Glue people, in this instance, does not refer to glue, but it refers to tar. Tar is an adhesive substance, and their intent was and is to turn every human they can find into tar people.

We have no choice but to use the local distributors selection of cleaning agents, but in time, we will one day, have all that straightened out, after we demolish the Lesbianists' hideouts, under ground, and after we kill them all, or welcome them in, as 'surrenders', with appropriate, remorseful, penentant attitudes.

Removal Of Latrine Wastes And Disposal Of Latrine Wastes

Latrine wastes materials shall be removed, and supplied to local pig farmers, who can then use the materials, for feeding the animals. Pigs and hogs love to eat away at latrine wastages, and no one knows that. Chicken also enjoy eating human wastages, as well as ducks, geese, and other fowl. Horses and burroughs also enjoy human wastages, if it is healthy enough, with large amounts of vegetable mass in the diets of the human beings, whose wastages are carried to the farms for spreading about in the hogs and pigs, barrels. A barrel is a place where wastages are loaded, up into trucks for delivery to a sewage farm, or a place where farmers can use the wastages, that the hogs are finished with, as fertilizers.

Hogs and pigs use a roped off area, for eating wastages, and employees keep track of the unloaded wastages, and the spilled wastages from the hogs, and then the spilled wastages from the hogs, are then moved to a separate area, for pickup by carriers of farmers. Foods grown at farms using hogs and pigs wastages are useful and nourishing to humans, and other animals.

No fees of any kind for loading and for carrying away wastes to hog and or also pig farmers, should be levied by truck drivers, as drivers will earn a tokenous gratitude tip from the hog and or also, pig farmer. An appropriate payment to the driver and deliverer of the human wastes to the hog and or also pig farmer, should be paid by the hog or also pig farmer, unless the farmer is cash strapped. Cash strapped hog and pig farmers may be given money compliments by the people at the collection site.

Money compliments are small awards, or minor payments, out of gratitude to the hog and pig farmer, for his or her useage of the

human wastes from the latrines. Money should be collected, regularly, if hog and pig farmers are cash strapped, and then given to the hog and pig farmer, out of gratitude to him or to her, and presented, tokenously, or as a gift payment. How much should be paid, depends on the expenditures of the driver, for his or her services, and for the use of his or her, vehicle, and for its whollyfied maintenance.

Whollyfied means, the regular maintenance that will allow the truck or vehicle to run at tip top conditon or shape, for the life of the vehicle, figuring it proratively.

Proratively means, spaced out, and paid proratively, or over the period, at regularly spaced points in time, over the given span or the useful life of the truck.

Discussions regarding this, and discussions for compensations, should be held at the collection site, and at the delivery site(s) for delivery of human wastes, by all parties, concerned, regarding all of this, and the primary collection site attendants, the persons elected by the attending or participating persons, at the collection site, who show the greatest interest and sense of responsibilities, at the collection site and with regards to the collection site, and with regards to the collection sites' safe, healthy, and wholesome management, must attend the discussions, and must deliver their sound judgements as to who is to be compensated payments for their participation in the removal and distribution of the wastes from the collection site, to the hogs and pig farmers, and as to how much should be dispensed, per each removal and delivery of human wastes.

Participating persons at the collection site, should elect attendants, and the attendants should regularly check on all points for the safe management of the collection site. Participating persons means, persons who are there for sexaling, and for depositing their holy, pure, sacred, powerfully cleansing, and GODLY sexaling juices at the collection site.

Nevada Power, and all other vendors, are not participating persons, and should not be construed as participating persons, regardless of what they might wish to think, and if they have any complaints, I authorise the killing of all persons who disagree, and persist in arguing that they are valid participants, despite their not participating in your holy sexaling, activities, as individuals, and not as company employees. No company employee, or personel of any kind, may participate, except as an individual, lone, and wholeseome, participating, sexaling agent.

A sexaling agent, is a person who is participating at the collection site to assist in the purifying of the parcel of land, on which I will build my ministry, with the assistance of my children, by their participating in sexaling activities, and by their depositing of their sexaling juices upon the grounds of the parcel of land.

How To Disperse Your Juices

Sexaling outdoors will normally require that persons are naked, and juices will naturally find their way to and into the ground. Men, boys, women, and girls, all must be naked, while sexaling outdoors, except for those persons who need to be on the move, such as male attendants, who will need to go around, periodically, checking on the points of interest, to maintain the soundness and integrity of the collection site, and of all things related to its operation and management.

Clothing

Clothes may be worn, at times while not sexaling, as particapating persons, decide.

Scarves, hats, and minor shawl like garments, Roman, Turkish, or Russian togas, or other comfortable sexaling apparel, for women and girls, to protect the dermal surfaces of the wearer of the scarve, hat, minor shawl, or other apparel, are allowed to be worn, while sexaling. We need every inch of dermal surface, bare and naked, if possible, or at least, accessible, to allow for maximum eroteming sensitivity, touching, massaging, tickling, and so forth, to heighten the erotic levels of excitement, and thrills, eroteming, orgasming, and phlumetting.

Men and boys may wear light weight garments, such as Roman, Turkish, or Russian togas, or other garments that do not interfere with access to sexaling buttholes, dicks, and so forth, for men and boys to be able to maximize their sexaling enjoyments, erotic attachments, their purposeful eroteming enjoyments, orgasming thrills, and pleasures.

Erotic Attachments

Erotic attachments refers to their titties, dicks, buttholes, mouthal holes, tounges, and other touch sensitive, eroticable and orgasmicable body parts.

Purposeful eroteming enjoyments means, their steady minded, determined, and sustained sense of attaining to the highest levels of eroteming enjoyments possible.

Leveling The Area

Some minor leveling of the area, for maximum use of the area, as an automobile and camper trailer, caravan bus, travel trailer, campsite park, will need to be done.

There are many tiny hills, and a few large ones. There is much dirt that can be removed, from the middle of the site, all the way back to the rear edge of the site.

There is a hilltop trailor park, past the edge of the rear of the parcel, and there will need to be built a very durable, and strong retaining wall, to keep that hillside, shored up, and to keep the

trailor park from crashing down the hill side, after slide begins, and creep causes the trailor park to fall into the open area, that will be needed to be excavated, all the way to the rear of the park.

The grade or slope of the hill, need not be steep, but can be at a relatively low angle of ascent. An angle of between ten to twenty five, to thirty degrees, in graduations, from front to back, can be accomplished, with little difficulty, and with no disturbment to the trailor park, or disturbment to the integrity of the trailor park.

We need not seek any permits for construction, as I do not recognize the Lesbianists' governments, on this planet, and if any person shows up who says he or she is a county or city planner, inspector, or whatever, you are to immediately kill the person, and deliver three fivers to the persons' head, as that person is a Lesbianist attempting to interfere in my religious activities.

All activities at the site are to be done, without any interference from any public or other authority, and all costs for all changes and alterations to the site are to be financed by the local construction companies, who are working on the hotels industry, and they will cease immediately their work on all construction, private housing construction, casino construction, and all other towers construction, or work construction, other than the basic infrastructure needed to support the present population of Las Vegas, Nevada.

We are taking over this town and you all will begin to prepare to vacate this town and hand over all of your construction equipment, now, or face your companies and your private persons destruction with my fracturable rocks bombs, begining with the New Orleans Hotel, and all related hotels, and casions, bars, and restaraunts. That means, every gambling establishment is to shut down, stop construction, and vacate this town, now, immediately, post haste, if you wish to live.

You will be destroyed if you refuse to follow orders. We are putting a stop to the non sense of the Lesbianists begining with Las Vegas, Nevada, Henderson, Pahrump, and all parts of Nevada and the Southwest.

You will disband your operations and hand over your companies, such as the water bureau, the power company, the gas utility company, and every other company, including all supermarkets, grocery stores, malls, and so forth, every last business in Nevada, and the south west, to the participants at the collecting site, to take over and then properly manage, until all residents of Las Vegas, remove themselves, to my kids facilities.

Is that understood? You are all resigning and moving into my kids place, underground, surrendering, and moving on for those who are not Lesbianists, but who wish to vacate this area, as this area is in whole, now, a religious grounds.

That means, that I will require the participants at the collection site to take over every thing, and to bring the news reporting

stations to their knees, and force them to report the news, that every one is to retire to my kids underground, fortress, and they are all to remove them selves from Las Vegas, now, post haste, immediately, other wise, we will have a fractuable rock bombs throwing contest, to see who we destroy, first.

You must surrender all your holdings, owned property, equipments, and every thing else you call your own, and hand them over to the participants at the collection site.

Is that understood? "YES SIR!" had better be your answer, or you will find yourself on a one way ticket to my Epcot Center, with no return ticket, guaranteed, for however long it takes, to find you tummy mommies and tummy daddies.

I don't think there will be many volunteers, in the near future, as you are all abominant kids of mine, and the only kids people will ever bare, for some time to come, are abominant kids, and animals, and animal humans abominant kids, so I do not think you'll be leaveing my Epcot Center any time soon, if you resist and if you force us to kill you.

Is that understood every body? Good.

The penalty for not complying is death. Do you understand what I am saying? I hope so.

The Party Is Over In Las Vegas, And In The World

The party is now over, in Las Vegas, and at all casinos and gambling establishments, as we know you are all cheating, and we will kill every single last one of you to close you all down.

Who Is Staying And Who Is Leaving, Etc.

You will close down all of your establishments, world wide, and lock the doors on them, and then demolish them, post haste. Is that understood? I hope so. Either you do it, or we will do it. Do you understand that, now? I hope you do, because we are going to demolish every one of your establishments in this town, if you do not demolish them, yourselves. Every last one of them, all houseing, except for those noted in my children's compliance statements, which you are all to recieve, all trailor parks, with some exceptions, all every thing is to be removed, with only the basic infrastrastructure for heating, lighting, water, sewage, medical, hospitals, medical clinics, pharmacies, and so forth, food markets, services industry, HUD, Welfare, SSI, and other operations for the welfare of persons who are here, who can not leave, or who will be staying for some time, and who will be needing the services of those agences, construction companies, lighting companies, electric infrastructure installation and maintenance companies, as well as gasoline supply and distribution vendors, diesel fuels supply and distribution vendors, restaraunts, and telephone. That means, all humans are leaving, except for those

person who are to stay on, as indicated in my childrens' compliance statements, and except for those who wish to stay on and participate in spilling their pure, holy, sacred, purifying juices, and those wishing to participate in purifying my area, all of Las Vegas, Nevada, the valley and beyond, in time.

Rules For Hospitals And Clinics, Etc.

There will be new rules for hospitals, and clinics, and my kids will see to it, that the new rules, are followed. There will be other rules, as well, and my kids will see to it, that they are followed, as well, or persons who wantonly disregard them, will end up in prison, underground. My kids have not only a living environment, they have prisons, as well, jail facilities, and many other things. Check with them for a fuller list, of what all they have in the way of facilities, as many are very nice, and there are great possibilities for improving your health, and rejuvenating your bodies, etc.

My kids have a full list of who is to be leaving, who is to be staying, and by when people are to be leaving, and where persons staying, are to be moving to, as we clean up this area.

All of you had better check with my kids, especially, you Lesbianists, but not only them, you religious fanatics, as well, and every one else, of course, or you, especially the Lesbianists and religious fanatics are at risk here, but not too much, the others who are to check in with my kids, risk dying, perhaps, prematurely, and then ending up in my Epcot Center.

My kids also have lists of who the people are who will be recieving all the properties for taking them over, which properties need to be demolished, who will be demolishing things, and how to remove those things that you must remove, and to where you will remove them, and dispose of them, and in what manner you will dispose of them.

You will hand over every thing, and you will all comply, and those who are required to hand over their properties, after complying with removal demands, will hand them over, and then will move out and into my kids place, in accordance with the time schedule that my children have for you to follow. You are required now to check in with my kids, get every thing sorted out, and learn all the details, and then comply.

Those who do not follow these orders risk an early and, fortunate for us, timely meeting with death, and entrance to my Epcot Center for a long stay.

Erecting A Partition Blind On West Tropicana Ave.

The roadway, West Tropicana Ave. runs east to west, and west to east, and it is advisable to erect a pertition blind, so as to not disturb traffic, that comes down the side of the road, the parcel of land sits on, at very fast speeds, with people rubbernecking to see what is

going on, as many people will possibly end up flying into the area, with their automobile, truck, gravel carrier, or eighteen wheeler spinnning and turning over, out of control, and then sliding off the roadway and into the collection site.

The traffic is very fact on West Tropicana Ave., and with the interest of the local area residents, who will learn about the collection site, and the activities at the collection site, there will be many hazzards arrising as a result. Some persons may decide to stroll through the area, to steal purses, or wallets, or cameras, and so forth, as there are many poor, indigent, or hopelessly poor, persons, in the area, who do not have any work, and who can not feed themselves, and they need to steal things, to sell, to earn a living.

Such people should be spoken to, and fed, and then warned not to act in an unrighteous manner, which means, please do not steal things, or damage the property, or any thing on it, and please do not get into fist fights, over insults, and disagreements with participants, about who is GOD, and so forth. There are many impoverished persons from South America, and Central America, who only know their local area witch doctor's teachings on voodoo men and voodoo women, and who know nothing but folklorish stories about gouls and ghosts, and people, or ghostly gouls, i.e., people immitating 'gouls', or mean and rotten people, who go 'boo!', or try to scare and rob people, in the night.

Electricity, Lighting, Etc., To Be Supplied By Nevada Power Free Of Charge, Or Else

The partition blind should be sturdy, tall, and break proof, so that vandals can not break it down, or climb over it. Lights for use at night, with the proper permissions for an electrical hookup from the Power Company, Nevada Power Company, will be granted, and provided by Nevada Power, along with all other neccessary, needed, safety lighting hookups, to illuminate the area, fully, at night, so that it looks just like, or nearly like, daylight, or a well lit soccer areana at night, or a well lit professional baseball field, or football field, at night, and it will be given for free, lest we burn down Nevada Power, and kill all of their Lesbianists employees, and meter men, and all of their tawdry workers, who we do not wish to deal with. That means, we will blow up their buildings, and kill them all, unless they give us the electricity that we require. If we need to kill them all, we will then acquire all of their holdings, and we will operate all of them, ourselves. Fair Warning has been given, and consider that as a done deal, unless you wish to visit my Epcot Center.

Meat Vendors And Hispanics From Central And South America

An air of friendlyness, but caution, should be used. Men and boys are there to protect the women and girls. So, please work in teams, and do not let individuals, who might get kidnapped, and sold off to meat vendors, for a few dollars, or pesos, as it is, in Las Vegas, as the majority of such kidnappings and sales of human beings to meat

vendors, the Lesbianists chain stores, such as Colonol Sander's Kentucky Fried Chicken, Burger King, MacDonalds, Jack 'n the Box, Wendy's, In-'n-Out, Fat Burger, Taco Bell, Dell Taco, and all the other, fast foods vendors, is by the locally landed hispanics from Central and South America, who need money, to stay alive.

Erecting A Partition Along South Decature Blud.

South Decature Blvd. also has much traffic on it, and there will be lots of people, rubber necking, to see what is going on, so a high, partition wall, made of lumber, should be erected down the side of South Decature Blvd. to prevent all such incidents of rubber necking, and reckess abandonment, from occuring.

The partition should be about ten to thirty feet high, and should be well constructed. Why so high? We do not want people climbing over it, to sneak into the area, to steal things, and to fight with people, and to cause trouble, and to come looking for young girls, and young boys, and helpless, elderly folks, and uneducated to the whims and ways of the downtrodden, brutal, abominant kids of mine, walking the streets of Las Vegas.

Yes. They are abominant kids of mine, and the proof of that is that their children come out as monkey people, and orangutan people, and chimpanzee people, and if possible, the hospital whisks the baby away from its mother, and disposes of it, in the prep rooms, used for killing incoming, abominant kids of mine.

Drawings On Demolition, Construction, Etc.

My kids have construction drawings for constructing all the facilities needed at the collection site for all the facilities that will be needed. They have electrical drawings for lighting, etc., health, fitness, and wellness facilities drawings, latrine facilities drawings, showers facilities drawings, food and beverage eating and drinking areas drawings, and all other drawings related to all things that will be needed to be constructed, or altered in any way, for our project to proceed, including but not limited to, demolition of the cliffs, leveling of the entire area out to Harmon Ave. and up to Flamingo, and back to Tropicana, as well as what is to be removed and leveled between Jones and Decature. There are a few minor exceptions, such as the building that I am living in. Who will move where, to consolidate staff at this project, and who will be moving out, at this project, and what will be leveled at this project, are all detailed in the program specifications, my children have. My present quarters, will be my place of residence, as things move along, and in time, in accordance with the schedule for construction, a temporary facility for me will be constructed near the area but between Flamingo and Tropicana, and somewhere between Jones and Decature. Please see them for details. After the area is purified sufficiently, and after all the areas to be purified, are purified, and my children will decide on when that is accomplished, my children will then activate the

technologies, and acquire the resources they need, and then they will build a more permanent settlement arrangement for all people concerned, who are staying on, if they decide to stay on.

The partical dismissive technologies and remissive technologies, for foods, and medicines, and other items that are needed, for continued survival, and for all other required purposes according to the specifications for the sexaling for a living programs, will all be provided to the participants who wish to stay on, and houseing for them, as well, will also be included. Parks will go up, and so will many other locally needed facilities. Many things will disappear, as my kids will partical dismiss the things and structures they need to remove, as they construct the new area, for all persons staying on in Las Vegas. My kids have a list of all the names of all the persons who may, if they decide to, stay on in Las Vegas, and not all of them, are local people, so you should all check to find out whether you name is on the list or not. All other persons, who are to be moving on, and all persons who do not wish to stay on, here, will be required to move into my childrens' present facilities, which they will continue to expand as we continue our program on this planet. We will eventually clear every one out of the area, inside and outside of Las Vegas and the Valley, and surrounding areas, and the world over, except for the persons whose names appear on the list, as houseing can be provided above ground, for participants in the juices spilling and areas purifying operations, by my children, if those persons wish to stay on and participate.

All other people will be required to move into the facilities my children have, and are continuing to upgrade, and expand, in their encapuslated living environement, in which, many people currently live. Persons in the encapsulated living environment, may also attend the collection site area activities, and future clearing activities, for purifying the areas with their pure, holy, powerfully cleansing, purifying, cleericating [cle-er-i-cating], and GODLY energies filled, sexaling juices. Cleericating means, the same thing as clearifying. It is just a slightly different but related word from another a variant language of English, and to cleericate basically means the same thing as to clearify. When we get the areas, cleared enough, and purified enough, my kids will then start building things for the participants. All others will move below ground, and live in the encapsualted living environement, until they have earned enough money, with their friends, as talked about earlier, to purchase a lease on land, and acuire the lease on resources needed, to build a home, etc., for a large group of people, who will be living together, and working together in the sexaling for a living programs, and so forth.

When Will This All Begin?

As soon as people begin to comply, we will begin our efforts to clean up Las Vegas, to begin with, and then, the rest of the world, and then, the rest of our universe. It will take a long time, as we need

to spill our juices, the lay persons, anyway, for some time, to come, as our universe is quite large, and so is the rest of it, that we are going to be recovering.

My Spilling Of My Purifying Sexaling Juices, And My Spilling Of My 'Prayer Time' Purifying Juices

I spill my juices, only for religious ceremonialing activities, during certain relgious ceremonies, and I don't spill my juices, on the properties, as I'm not set up to spill my juices, on the property, now, and will not be set up to spill juices, until I find an excuse for that, and an excuse for performing a religious hand prayer signaling ceremony that will require my spilling of my juices. It's pretty hard to spill juices, when there are no other persons working with me, and I do not work with lay persons, unless they are confirmed by me, and so there will be maybe, some confirmations, but not neccessarily so, as I do not know who is going to wish to be confirmed, and by the way, who ever it is I confirm, must realize that I am the Mother and Father of all human beings, animals, and living beings, and the Creator of my universe. There are not that many people who understand that, except for my kids, my working, unionized kids, and so it will be some time, yet, maybe a few hundred or more years, before some one realizes, 'Hey, he IS the Mother and Father of all human beings, etc., etc., etc.,"

Spilling 'Prayer Time' Spittle Generated While Praying

Until then, I'll use my spittle juices if I need to drop or drizzel any juices, that I generate while I am religious hand prayer signaling, as I don't like or care for the idea of jerking off in public, to spill purifying juices, in public, regardless of the fact, that I am GOD, so it ain't going to happen, any time soon. When I find a authentic 'believer' who realizes and understand that I am GOD, and so forth, I'll begin my public spilling of sexaling juices. I don't mind it in private, but it is not going to happen in public.

Monkey Babies, Jimmy Carter, Oliver North, And The Lesbianists' Conspiratorial Bullshit Stories Of Adam And Eve, And "Jesus Saves"

Most people do not know this, but many births end in tragic loss of the child, because Jerry Falwell, Oliver North, Jimmy Carter, Ronald Reagan, George Bush, Jr. George Bush, Sr., and the rest of them, order and expect all the Lesbianists doctors to kill all babies born to people which do not look human. Doctors at birthing hospitals also comply, quietly, as it is hospital policy they can not break. If they go against it, they risk losing their job, and possibly losing their life. This is not a joke, and it is the Lesbianistgs policy of having all birthings in hospitals exactly for this reason, for disposing of non human looking babies, at birth, so that their bullshit creation by God, of a 'pair' of people, Adam and Eve, and that "Jesus Saves all good Christians", can not be contested, by logical proof of non human births to human being couples, or single parent women or girls.

Abominant kids are born every day to my kids, on this planet, and they are all executed, or killed off by the local citizens, by their fright and fear of 'ghouls and ghosts' and 'goblins' in the night that go, 'Boo!'. These idiots, both the abominant South Americans, Central Americana, and all my other abominant kids, North American, Europeans, Russians, Chinese, Japanese, Thai, Philipine, and so on, must ask them selves why they are blessed with babies which are either not human or are abominant humans, or part animal humans. If they ask them selves these questions, they will find out the only answers are that these people born to them, are my children, and my children are born to them for reasons that have not been disclosed to them, before, by the clergical societies, i.e, the religions of the world, and by the other societies, set up by the Lesbianists, or by societies nurtured along as part of the Lesbianists' 'tragic comedy' of their toying with your lives for their humoring themselves, and for their amusing themselves. Once we get rid of the Lesbianists, and their ways of doing things, we will begin to see babies that are either not human, or are only part human, in animal bodies, and they will be born to all of you who are tummy mommies, and tummy daddies, if you birth enough children, to find out. How many is enough? About one in forty or fifty by my estimation, but depending on the person, it may be between thirty to eighty, from one person to the next. Take that to your pastor, and tell him or her, to stick it up his or her ass. It is the truth that animals are born to humans, all the time. Not only that, but abominant kids of mine, usually of the apey kind, but not always, are born to the 'normal' looking humans on our planet, and in our universe. We need not be afraid of these children, as animals, can be collected and put into zoos, and animal humans can be raised by the parents, or parent, in the case of a single parent. In time, we will adjust to this reality, and we will raise fine children, abominant animal humans, or human appearing abominant children. That means you are all abominants, and the Lesbianists are laughing at you, and at themselves as well, as they go around and kill and cravenly torture every possible person they can. We will put an end to their craven ways, and we will make a wonderful universe for all of us to live in, in peace, and serenity, once we get started practicing my religion, and once we begin erasing, sufficiently, our karma and our karmic markups, with your purifying sexaling energies, prayers, and other activities, such as syncopated dance, syncopated excercise, syncopated sexaling, and so forth. You time it to the metronome at one thirty seventh, for now, and that will be fine. In time, we will get accurate metronomes, and then we will chance the pace, just ever so slightly, to push my kids along, as I explained about, for our wholesome and healthy universe, for all of us to live in, together with each other.

Punishment For People Who Practice Voodoo Religions Is Dismendment, I.E., Death

We will not be killing or executing children any more, at hospitals, or at homes, or in primitive, backwards towns and villages, or rural hideaway villages, where voodoo religions muster the people into

peculiar states of mind, where they become entranced, and then begin mindlessly, acting like chickens, and birds, or fowls, or hippos, and so forth. There are too many of these types of so-called 'religions' in this world, and we are out lawing all of them, and punishment for adhering to them, will be a trip to my Epcot Center, as I have my children particle dismiss their bodies, and then dismend them, bit by bit, into their base components, and then have my children whisk them into my Epcot Center. We will bring every one up to the level of education every one needs to be at, to better understand my universe, and those who persist in abandoning their obligations, will be dismended with out further notice, after they are sent their last warning ticket, from my kids, in accordance with Gurkian Law. That also applies to the Lesbianists, and to every one else, who is unable to get the picture here, and get with the program. There will be no exceptions. And, this is not a joke. My kids have courses for you to educate your self in, to pull yourself out of the past Lesbianists' way of life and thinking, and into the new and current, reality, that we will be living in, for ever, from now on.

Local Businesses Will Have No Problems At All With The Collection Site And Will Have No Problems At All With The Activities Of The Faithful At The Collection Site

Walgreen's is across the street, on one corner, and Home Depot is on another corner. I don't think Walgreen's will have any problem with you using the site for your camping, for your meeting with others, for your sexaling with others, and for you and your friends' purifying sexaling activities in that park, i.e., the collection site. Home Depot, I don't think will have any problem with your use of the parcel of land, either, for those purposes.

What To Do If The Police Come?

Now, if the police come, and I'm there or not, I don't know what they'll say, but they have not got any right to say any thing to any one. Is that clear, Mr. Mayor of Las Vegas, and every one else in the area. I hope it is, as I am not going to stand for your interference or any one else's interference in my religion and in the relgious activities of people who wish to participate in my religion, sexaling to purify my universe. IS THAT UNDERSTOOD, MR. MAYOR AND EVERY BODY ELSE? I HOPE IT IS! AS A 'NO SIR' WOULD BE UNACCEPTABLE!

Now that we have an understanding, I think there will be no problems, and if there are, I will see what I can do about it, by calling my kids up, with my religious hand prayer signaling ceremonies, to see what they can do for you, to help you out, and to break the backs on law enforcement officers, and the Mayor of Las Vegas, and every other person, Lesbianist or not, who tries to interfere with me, or who tries to interfere with the people practicing my religion. I will not stand for any interference from any one, including Mr. George Bush, Jr., the current president of the United States, or any one else, such as the Mayor of Las Vegas, or the Governor of Nevada, or the Nevada

Highway Patrol, or the Nevada Sherrifs Dept. or the Las Vegas Metro Dept. or with any other persons or parties, such as the Las Vegas Gaming Commission, or any other Lesbianists' or Lesbianistic organization set up by the Lesbianists, and that means all you church goers, parochial school teachers, and students, and others, and if any one interferes with any one who comes to my ministry's claimed parcel of land that I am purifying for setting up my ministry, and if any one hassels any one there, than who ever is visiting the collection site, to help to purify it, you have my permission to kill the persons attempting to interfere in any way at all, on sight, with what ever you have to kill them with. Please dispose of their bodies in the nearest trash dumpster.

DO YOU HEAR ME? MR. MAYOR. YOU ARE A DEAD MAN IF YOU EVEN TRY TO SEE WHAT MY RELIGIOUS FAITHFUL ARE DOING, AND SO IS EVERY OTHER PERSON ON EVERY SCHOOL BOARD AND CHURCH OR OTHER LESBIANISTS' COMMITTEE. IS THAT CLEAR, EVERY BODY? GOOD!

You will not interfere with my religion, and with my religious faithful, and they will come to Nevada, and they will come to Las Vegas, and they will start sexaling on that property as they see fit. Does every body understand that? I hope so. Now. Non responsive persons, who ignore my statements, will find themselves in trash cans, and trash dumpsters, every where in Las Vegas, and any where else, where there is a convenient trash can or trash dumpster. There are lots of them around, and people are throwing dead people into them, every day, across the country and around the world, and they all end up in landfill sites, and so there will be no added charges for our using the statewide Nevada Silver State trash retainers and containers, for however many others who need to be killed, and for my religious faithful to then place them into the trash cans and trash dumpsters. No charges should be levied by any other Lesbianists' trash collection company, around the world, as they are all owned and operated by the Lesbianists, and we will not support them, in any way, what so ever.

If Mr. Mayor would like to be the first guest inside of one of the Nevada Silver State trash dumpsters, then he will try to interfere, in person, and he will be shot, point blank, in the center of his head. You will then kill him with three fivers, to make certain he is on his way to my Epcot Center, for his next trip out as a tummy baby. If the Governor of Nevada wishes to interfere, then he does so at the risk of being shot, killed, and made certain he is dead, with three fivers, and then after that, he will be deposited into a local or state trash dumpster, either here, in Nevada, or in California, or Arizona, or where ever it is convenient to dump him into a trash can, trash container, or trash dumpster.

Lesbianists Enjoy Eating People, Who Are Alive, As Well As Eating The Bodies Of Those Who Are Dead

You should let the state's vice mayor of Las Vegas's office know, who was shot, killed, and confirmed dead, after depositing three fivers into his or her head, and then where the body is, and generally when the body was dumped, so that they can get an idea of how decomposed the body is, and whether or not the body is in a land fill site. They can then check on it, and verify that the body will make it to the land fill site, if it isn't already, there, where all the other bodies, are ending up, unless they have already happened to have beeb eaten up by the Mayor, or by the friggen Governor, or by the Sherrif, or by another Lesbianist.

All persons are free to travel to Las Vegas, and they are invited to stay at the parcel of land that I described, and they are invited to make it into a nice camper trailer area for recreational vehicles, or for what ever other types of outdoors camping vehicles, travel trailers, caravan buses, or any other types of camp site temporary stay, housing and living arrangements you would like to use the area for.

Every Game Of Chance, Gambling Machine, Or Slot Machine Is Rigged, In Every Casino Around The World, With Only A Few Exceptions

If you will all sexal, regularly, to the best of your abilities, and help me to purify the area with your sexaling, undisturbed by any one, and clean it up with your purifying energies, you are more than welcomed to come and enjoy the area, and see what fine attractions, will be leaving Las Vegas, in the not so distant future, including the gaming commission, with all their phoney, rigged gaming systems, that the Lesbianists control.

The Lesbianists' Articles Of Participation

The Lesbianists have every game that you can possibly rig, controlled by electronics devices, or by slight of hand, mechanics, who control the gaming rooms, and gaming halls, so that only Lesbianists win any money, that is worth mentioning about, and so that the Gaming Authorities, and the Mayor's office, and every other Lesbianist organization in Nevada, who has any one in their office, can then go and get the money the Lesbianist won, and get a percentage of it, given back to them, as they have arranged to do that, as that is part of their oath, and part of their sworn promises to do, as that is written out in their articles of participation, their rules for living upsite, not down below, in the labrynthine cities, and every Lesbianist must follow those rules, and when they win the Megabucks, and every Lottery in the world, they must give back money to the Lesbianists, as every game of chance that is run in this world, except for bingo, is rigged. However, even Bingo is rigged, in some ways, by people switching cards that look like winning cards, while players are not looking, and by other naughty tricks.

Every Lottery In The World Is Rigged

Every lottery in the world, performs the drawing out of the balls before a live audience, in most cases, before they actually air the show, and they have illusionary tricks they play, with the technologies they have, and they sucker people out of their money, daily, around the world. Las Vegas is no different, and they sucker every one out of their money, except for the Lesbianists, and they let some people, win now and then, small jackpots, on the gaming machines, and then after a winning streak, they set the machines the person uses, so that the person can not win a dime. They have the technologies for rigging every machine in Nevada, and across the country and around the world, so next time you visit one of their casinos, be sure and detonate one of our bombs, you can make, and destroy that casino. Is that understood? I hope so, as every day, millions of people are being suckered out of their hard earned money, they pay taxes on, through the nose, till they are practically choking, and the Lesbianists take it, and support their folley and games. They also support their folley and games with your revenues, that they make sure you lose, at every casion, and at every gas station, with a convience store, that has gambling machines in it, for you to deposit you money into. Every lottery in the world is rigged, and so if you spend money on it, if you are not a Lesbianist, you are just throwing your money away.

No Fair Play In Nevada, And No Fair Play In The World

There is no fair play, here in Nevada, or any where else, in the world, and I would like you all to know that, and become aware of that, and then I hope you will tell your friends about it, and then I hope you will destroy every single last one of their casinos, and gaming machines. We are not going to allow them to continue their frolicking at your expense, and we are going to destroy every last one of the Lesbianists, as soon as we can. If they prefer to surrender themselves to my kids, than we can allow them to live. However, if they do not surrender themselves to my kids, then we will kill them all. And there are no 'maybe's' about that.

Sniper Shooting, And Miscellaneous Information

You have my permission to sniper shoot any police officer, park ranger, sherrif, or other person, plain clothesed police officer or detective, with or without a gun, on sight with your scoped rifles, and targeting assistant who will determine range, from your bunkered in the hillside, shooting site. Any hotel in the area, which might harbor shooters from local police, sherrif, or SWAT team operations groups, you have my permissions, and blessing, or go ahead, and my 'okay, and 'approved for action' sight of appeal. Sight of appeal means, my blessings, based on your determination as per your good judgement.

One hotel that is clearly the most convenient, and the closest with in shooting range, at close range, is the New Orleans Hotel. Hotels within shooting range, at a distance, are the Palm's Hotel, The Rio Hotel and Casino and its seperate tower wing, and a few others, off in

the distance. You'll have to come and look at them from the approximate location of the site after you determine where every thing is, to locate and determine for your self which hotels and towers need to come down, and what you will need to bring them down. There is a tower off in the distance, a new hotel, that is going up, that I do not know the name of, but is clearly within shooting range, and needs to come down, and people are on it, daily, welding, and you can't miss it, if you look in the north easterly direction from the site. There is the Stratosphere Hotel and Casino, which also needs to come down, which is further over to the west from the new hotel wing that is going up. There are many scaffoldings in the area, that also need to come down with explosives, fracturables rocks, fuels, chlorine, and high temperature minerals particles ignition, and particles burnings bombs. There are probably a number of other landmarks, hotels, casinos, bars, restaraunts, trailor parks, trailors, houses, apartments, condominiums, near or off in the distance, that also need to come down, and need to be demolished with my light weight explosives fuels, gunpowders, metals particles, and chlorine plastique explosives bombs.

You will destroy them all, and you will come prepared, or be prepared to acquire all the demolitions needed to destroy them all, as well as to destroy all the local police and sheriff's many Metro offices, SWAT Teams offices and units, Fire and Rescue Ambulance units, Lesbianists' Hospitals, and other Lesbianists facilities, throughout the Las Vegas Valley, Henderson Nevada, North Las Vegas, Pahrump, Mesquite and the whole Southern Nevada, westward to San Diego, California, northward to Los Angeles, northward to San Francisco, California, northward to Berkely, California to Oregon, and Washington State, and back down to Reno Nevada, Arizona, New Mexico, Albequerque, Houston Texas, Dallas Fort Worth Texas, and all areas where there are tactical SWAT team units, military units, militia units, as all militias are organized and operated by Lesbianists, despite popular beliefs that they are independent of the government, and anti government, as we often see on the "TV for the Brainless", as they are often refered to, i.e., the general public.

You will destroy all law enforcement offices, and personel, and all military and militias. All governments, their offices, and employees, are to be destroyed, and all personel are to be executed, except for those who take it upon themselves to execute the Lesbianists among them. My kids have a full list of all the places and structures that need to be destroyed, and demolished, and so please see them for that information.

Your Orders Are To Kill The President Of The United States And His Wife

And to repeat, your orders are to kill the president of the United States, George Walker Bush, Jr., his wife, Mrs. Barbara Bush, Jr., and all of his and his wifes' Lesbianists' associates, pretend relatives,

and friends.

We are not going to let this stand, another moment, and if they do not surrender to my kids, you are to execute them all. My kids have a list of names, of those, who have not surrendered, as yet. Please see them for and ask them for that list of names of persons who have not as yet, surrendered, and who need to be executed, post haste, immediately, or, ASAP.

United States President George Walker Bush, Jr., is no exception to this, as he has not surrendered, as of yet, and that is confirmed. Neither has any of his colleages, or congressional office holders and diet or congress members, except for Ted Kennedy, and one or so others, and maybe a cabinet member, one or there abouts, but I haven't confirmed that, yet. There are some members of the congress who are not Lesbianists, and you can get their names, on a list from my kids, as well.

Captain Off The Bridge.

Texas's Lesbianists' Latest 'Vaccine' And Texas's Attempts To Destroy Women's And Girls' Vaginal Lining And To Destroy Women's And Girls' Cervical Lining, Causeing Stillbirths To Increase, So As To Prevent The Successful Birthing Of Children - Latest Lesbianists' Vaccine Will Cause Numerous Problems - Execute United States Of America, State Of Texas, Governor Perry And Family - Underground Books Distributor's For Militia Types Folks - Information On Bombs Making And Detonators On The Web - Solar Flares And Flare Igniters - The Lesbianists' Balooney On Minus Charges As Opposed To Positive Charges - The Lesbianists' Maps Of The Brains - Execute The Current President Of The United States Of America, George Walker Bush, Jr. - Lesbianists Who Decide To Sexal In My Religion With Lesbianists And Non-Lesbianists' Persons - Citizens By Proxy - Temporary Full Time Citizens - What To Do About Untimely Pregnancies, Health Issues, Medicines, And Regroverative Formulas - Medical And Housing Benefits, And Other Health And Work Related Benefits - When Can People Begin To Come So As To Be Able To Participate? - Sniper Points, Places Where Snipers Shoot From - Pocket Knives, Construction Tools, And Miscellaneous Daily Life Management Tools And Equipment - Hookups For Travel Camping Vans And Similar Vehicles - Cleaning Up The Area And Throwing Away The Garbage - Schedule For Leveling Of The Ground And Hills In The Area, Removal Of Unsightly And Smelly Garbage - Setting Up New Facilities - Fountains And Showering Lamponeers - Restaraunts, Clubs, Lounges, Eateries, Cafeterias, Bars, Pubs, Bicyle Paths, And So Forth - Dealing With Criminally Minded Persons - Alterations, Modifications, Changes, Clearing Up And Removal Of Garbage In The Areas, And Additions Time Schedules Updated: 12-02-07 Rev.a.00.a 02:30 PST

Texas's Lesbianists' Latest 'Vaccine' And Texas's Attempts To Destroy Women's And Girls Vaginal Lining And To Destroy Cervical Lining, Causeing Stillbirths To Increase, And To Prevent The Successful Birthing Of Children

The latest attempt by the Lesbianists' governments of the world, near by my computer window, on the internet news services, to destroy and toy with the human population of this planet, has been launched in Texas, and is targeted at women and girls, and their ability to have children.

See the article at the end of this post.

The new vaccine, which is mandated by Governor Rick Perry, who signed it into law, and is now obligatory, unless you protest it, and go to

court, and spend years fighting it, as an individual or small group of claimants, will destroy the vaginal cervical collar and the lining that holds every thing in place, and supports the interior of the vagina, thus making it impossible to carry a fetus to term. The vaccine is also targeting the brains fibers throughout the human body, and the fibers of the brains in a woman's or girls' body will slowly rot, and decay as they are eaten up by tiny animals that eat these energies conducing fibers, synapses, relay switches, and other related energical brainal related things and dings thoughout the body.

Latest Lesbianists' Vaccine Will Cause Numerous Problems

It will also speed up the eating away of the enamel of the teeth, and of the bones in the woman's and girl's body, her fingernails, and her skin membranes NS membraneous tissues throughout the body, and on the exterior of a woman's and girls' body, making the women and girls grow older looking at ever more younger ages, and making women and girls susceptable to skin cancer, melanoma, herpes, genital warts, other infestations of animals in the skin, and other skin related membrane destructing colonies of animals, that they use from out of their Bio Chem War encyclopedia of how to destroy human beings, with poisonous and health problems causeing crystals cages animals of all kinds. Especially numerous are the Bio Chem Warfare crystals cages animals of the petroleum industry's based kind.

The vaccine is no different from any other of the Lesbianists vaccines aimed at destroying the health of the people who live on this planet. It is compared to the 'polio' vaccine, in the news article, and that was similarly an attempt at destroying the health of the human being, by making the human being incapable of haveing any sexual orgasming capabilities, by killing off all the sex related animals and bugies in the body, which make sexaling juices, that make eroteming and orgasming possible.

Thus, this latest attempt at destroying the health of the people who live on this planet, locally, in Texas, and that I know of, anyway, is nothing more than the Lesbianists toying with the people who they are here to amuse them selves with by destroying them, little by little, over a long period of time.

Execute United States Of America, State Of Texas, Governor Perry And Family

This will not stand, and you will all destroy the capital of Texas, and Governor Perry's mansion, and the Governor and his wife, and their family, pretend or otherwise with my fracturable rocks and fuels chlorine and explosives, etc., bombs, that you will make in your home's garage, or workshop, safely.

Underground Books Distributor's For Militia Types Folks

Use the delayed timer invention, that is a workable time delay detonator, that I've explained about, especially if you use black

powder gun powder, mixed with axel grease, turpentine, benzine, chlorine, using also some Elmer's glue, prior to mixing with chlorine, and then set it in a warm cupboard, to ferment for a few days, to then turn into a nice plastic explosives mixture for detonating with the string of flash bulbs wired to the alarm clock trick, as described by Ragnar or by one of the other bombs making specialists, in their sub culture literature for militia types folks, who wish to destroy the government.

They find the list of names of all the people who request the literature, by mail, and then they go and watch them, with their surveilance technologies they have, and then they either capture and torture them, and then kill them, or they just make sure they are die, in a fatal car accident, or whatever.

Paladium Press is one of the Lesbianists' book publishers, and there are others, and this one is affiliated with the National Rifle Association, a Lesbianists organization.

This publisher has titles sold to underground books distributors, and you can find a number of underground book distributors on the internet, which carry more titles than Palladium press.

Delta Press, who publishes their books and paraphenalia distribution listings magazine, 'Delta Force' is one of these distributors of interesting underground literature.

http://www.deltaforce.com/catalog/page30dp.html

'Home Made Fireworks', is one web page to look at, if you have the time.

http://www.deltaforce.com/catalog/page28dp.html

'Booby Traps, Explosives and Black Medicine', is another useful page to look at, as well.

http://www.deltaforce.com/catalog/page30dp.html

There are a number of other distributors of underground literature, and some have better selections than does Delta Press.

In any case, with a little research, there are plenty of 'timed detonation devices' drawings, and explanations, for you to view, and learn from, that will help you to construct a timed detonator, that will allow you to safely set off one of your plastiques bombs made with my explosives formulas.

Paladin Press, you can find their books at Amazon Books on the web, another Lesbianists owned corporation, is another publisher of interesting underground literature, that can be useful for you to study and learn from.

Paladin Press can be found at, http://www.paladin-press.com/

Books for supposed 'Professionals' who are anti terrorists professionals, that allow them to detect the different types of bombs people can make, and then use to destroy others, is sort of a tounge in cheek joke of the Lesbianists, for luring in people who wish to find information on bombs and explosives.

There are many useful books published to help beginners understand the basics of bomb making. The idea is to use the information for professionals who wish to understand the craft of making bombs, and detonating devices, and then use that information to build your bombs and your detonating devices.

The flash bulbs wired to an alarm clock with matches and ignitable phosphates glued to a string of flashbulbs, wired properly together, then crushed, so as to expose their flash and heat ignition coils filaments, for your detonating heat energies ignition needs, is one of the basics and you can find it in one or another of the underground books on bombs making and detonation devices making for 'professional' anti terrorist's private investigator or bombs detection professionals types.

This is one of the ways the Lesbianists lure in persons who know nothing about weapons, and then they find out who they are, and then they make friends with them, and toy with them, and introduce them to their Lesbianists' friends, and hang out with them, and pretend they are all friends, then one day, they all attack the person, and torture the individual, and get their kicks, amusing them selves, by ripping the person up, or by hanging, and nailing the person to a wall, with a nail gun using, approximately, three inch nails, and then hammering in longer, seven inch to twelve inch nails, or larger ones, or other similar nonsensical, childish, but fiendish behavior.

The "BRUTAL ART OF RIPPING, POKING & PRESSING VITAL TARGETS"
"by Loren W. Christensen"
http://www.paladin-press.com/detail.aspx?ID=1441

Is a beginners guide to ripping people apart, one arm, or leg, at a time, or with team work, one half of a person can be ripped from the other half, if you hold the right bones in place, and then, using teamwork, rip the person into two or more pieces. This book gives a person a preliminary sense of what he or she can muster, as an individual who attempts to rip at a person, and tear the person apart, one limb at a time, or with friends, how to rip a person up, one piece or more, at a time. Ripping people up is accomplished best, if they are unconcious. If they can not fight back, or resist, it is easy to rip a person apart, if you have the needed strength. Since many people have ancestors who were monkeys, chimps, orangutangs, guerillas, and so forth, with tremendous muscles strength, there are lots of very tiny persons, with phenomenal strength, and they can easily rip a person in two, by them self, if they try.

Books on booby traps for law enforcement personel, are simple descriptions of bombs that they may or may not encounter, and there

may be some useful information in some of them such as,

"BOOBY TRAP IDENTIFICATION AND RESPONSE GUIDE FOR LAW ENFORCEMENT PERSONNEL"
"by Tony L. Jones"
"This manual teaches cops and other law enforcement personnel all they need to know to recognize a booby trap and respond properly. Find out where booby traps are most commonly employed; the 11 physical signs that most often signal a trap; what to do (andnot do) if a trap is suspected or found; how to safely search a building, outdoor site or vehicle; and the one indicator that practically guarantees that a building has been booby-trapped. Shows more than 90 different booby traps in place. For academic study only. 5 1/2 x 8 1/2, softcover, photos, 80 pp."

There are others, which you can also find, that will provide schematics, and drawings of useable ambush related devices, and detonators for them.

"Contingency Cannibalism", sold through Paladin Press, and other 'underground' book distributors, is one of the Lesbianists' favorite books, that help them to track persons who they would like to later, cannibalize, themselves, as a joke on the person.

"CONTINGENCY CANNIBALISM"
"Superhardcore Survivalisms Dirty Little Secret"
"by Shiguro Takada"
"This twisted, tongue-in-cheek look at cannibalism as a last-resort survival option analyzes real-life case studies and historical episodes of cannibalism. Then it examines the hard-core decisions and gruesome details one must know in order to partake in this grisly practice. Recipes included. For entertainment purposes only. 5 1/2 x 8 1/2, softcover, 160 pp."

The Rusksack, "Survival Information Clearinghouse", is just one club of members of mainly Lesbianists, who have fun toying with the people who live on this planet.

http://therucksack.tripod.com/survival.htm

Information On Bombs Making And Detonators On The Web

For information on making detonators, and other bomb related stuff, please see this web page as it costs nothing.

http://www.bombshock.com/archive/Homemade_Bombs/

Solar Flares And Flare Igniters

A solar igniter as talked about in the article on page,

http://www.bombshock.com/file9/crtrmkr.txt-Crater_Makers-932.htm

'Crater Makers', is a solar flare igniter, a device that is used in solar flares, or night time distress signal flares, that ignite the flare, by sending an electric battery current into the flare phosphates holding tube, down a wire, on an ignition circuit, and then igniting the distress signal flare.

You can find solar igniters inside of distress signal flares that are used on boats, for shooting up into the air, with a flare gun for maritime use, that will send the distress signal flare up into the sky, if you have the flare gun pointing in that direction, and then at a certain altitude, a trip switch circuit is activated, due to air pressure, or due to timing from time of departure of the distress signal flare from the flare gun barrel.

You have to exhibit extreme caution, when taking a flare apart, as it can detonate, accidentally, and they are not made in a way so that people can safely take them apart, and people who try to take them apart, are accidentally injured, on a regular basis. Do not use this, if you do not know any thing about demining, as a professional mine deactivating specialist in the military, or with military training. This is best left up to the professionals, and is not meant as something the average house wife, business man or business woman, or chemistry or other studies, school student, should attempt.

You can use a flash bulb, and get the same results, if you glue some gun powder and phosphates to the flash bulb housing, and then crush the glass, and then wire it properly to a common house morning wake me up, alarm clock with a striker bell and a striker that moves back and forth. The circuit is simple, and you can figure it out with little difficulty.

The Lesbianists' Balooney On Minus Charges As Opposed To Positive Charges

Remember the minus sign on a battery is where all the activity of the little energies kids is going on, and the Lesbianists purposefully teach that the positive side is where the current is moving out of, and around towards the negative side of the battery. The Lesbianists teach that the active side of the battery is the plus or positive side, or the side with the plus sign on it, when you look at a common house hold nine volt battery, and that the non-active side is the negative side, or the side of the battery with a minus sign. This is false. The side with the minus sign on it, is the active side, and that is where you do not want to wire any thing to, unless you know what you are doing. The positive side has no activity going on, and is safe to touch, but the other side is not safe to touch, and the testing meters are wired to show you that the reverse is true. They have tampered with the design of testing meters, so as to support their allegation and falseity, that the minus side is where there is no activity, contrary to the truth.

That means, that, the flash bulb igniter system and the flash bulb itself should indicate that one side is the positive side, for the

positive wire to be attached to. You had better check carefully, and make sure there is no mischief here, as you do not want to detonate your igniter, accidentally. Ask a qualified electronics specialist to do all your wiring of your detonators, as he or she is the only person qualified to wire these types of detonators.

The Lesbianists' Maps Of The Brains

It's rather confusing, the way the Lesbianists have reversed things, and have messed around, so as to thwart your attempts to make nice detonators that work every time, unless you have a normal set of brains, which unfortunately, I have not got a pair of, or triple set, or more of. That's sort of a joke. On a magazine, yesterday, I saw how the Lesbianists teach that one part of the brain is for speech, and one area of the brain is for speaking, and one area of the brain is for sight, and one area of the brain is for logical thinking, and one area of the brain is for signing, or one area of the brain is for artistic inventioning, and so forth, but that's a lot of hog wash.

The brain is not partitioned in that way, and they know it, and they are misleading every one, and laughing at all of you while they are doing it, with their 15th to 17th century style drawings, that they have plastered on all the Time magazines, or what ever magazine cover it was on, that I saw in the check out lane, at the super market, yesterday. You have kazillions, and more of parts to your brains, and there are so many, it is unlimited, nearly, and your brains are so complex, and you have got brains in lots of other places in your bodies, other than in your head, and I'm not going to go into that one, now, but the Lesbianists are lying through their teeth, when it comes to this type of pseudo historically backwards, archaic, or cave dwelling human's notions on science, that should insult a first grader, or kindergarden school student, or preschool student.

In any case, ask your local electronics' specialist or house hold electricians' specialist, or handy man repair persons, who work for house hold water heating devices installation companies, or other electrical home appliances sales and installation companies, who also get confused, from time to time, as I've witnessed them, personally, blow up breaker circuits.

Get a qualified, and that's hard to find in so far as I've witnessed them at work, electronics' specialist to wire your detonators, or go take a course with my kids, as they have courses available on wireing such devices.

There is no minus charge, and there is no positive charge, and that is what you should understand. There is a side to the battery where there is lots of activities going on, and that is the minus sign side on the battery. The positive sign side on the battery is where there is little to very little or nearly no activity, but no activity is not the truth, either, as there is activity, you just can not measure it with todays' electronics measuring devices, as they are not

technologically sophisticated enough to be able to detect the activity, though I'm sure there have been intrepid scientists who discovered that both sides of the battery have activity, and then they were shot and killed, after that discovery, by a Lesbianist assasin, or by a hired assasin, assigned or paid to kill the scientist who discovered that there is activity at the 'minus' side of the battery as well as at the 'positive' side.

That means, that you need only concern your self with the 'minus' side, since you will not be able to detect any thing at the positive side, unless you use the reverse wired electronics and electrical energies detection devices that the Lesbianists market through Tandy, or Radio Shack, and at Sears, and so forth.

It gets confusing, a little bit, doesn't it. Anyway, go and take a course at one of my kids classes, after you sign in, and swear in as a jr. member to our new country, which I haven't sworn on to, as yet, or joined - but though I am the boss of, regardless - since my kids do not speak to me, on a daily, or weekly, or other basis, and I just happen to be able to know what they are doing as they tell me what they are doing, through some secret port hole in one of my brains some where, in my toes, or nose, or who knows where, as they telegraph or some how signal in, using semiphore signaling, or probably hand signaling, that my brain then catches, and then passes on to me, their messages that they signal in to me, and the news, as well, about what they are doing, and about what is going on with them, and about what is going on with some other things, as well.

Since I am GOD, I happen to have a right to know this stuff, what they and every body else is doing, on a daily basis, but they haven't told me how my brains catch their information, yet, or the other information that gets there, some where into my one or more of my brains, and I haven't figured it out, yet, myself, either, though I think I know something, a very little something, about how it works.

This does not mean, that my brains are unreliable - except for my memories areas of my brains, in particular - but that I am just waking up to what is going on, here, and I have a few kazillions of years to work out every thing, or some of the basics, any way.

In any case, you have all been snookered by them, with regards to their non sense sciences, and you are being laughed at, and toyed with, daily by them. That happens to be the truth, whether we find it pleasant or not.

Execute The Current President Of The United States Of America, George Walker Bush, Jr.

In any case, the Lesbianists are a twisted group of individuals, who toy with the people who live on this planet. Mrs. Hillary Clinton, Bill Clinton, George Walker Bush, Jr. President of the United States, his wife, Barbara Bush Jr., George Bush, Sr., former president, and

his wife, Barbara Bush, Sr, are all gagsters, or jokesters, who wish to only toy with you, and eat you, or deprive you of your life, and of your rights, in fiendish and horribalistic ways and manners.

They are all to be executed, especially George Walker Bush, Jr., President of the United States of America, currently residing at 1600 Pennsylvania Ave. Washington DC, in what they call the White House. You are to kill them all, and send every last one of them to my Epcot Center, as soon as is convenient for you.

Lesbianists Who Decide To Sexal In My Religion With Lesbianists And Non-Lesbianists' Persons

If any Lesbianists decide to sexal in my religion, with their friends, and their friends may include other Lesbianists who decide to sexal, as well, as well as, other people they know, then they may begin sexaling with their friends in my religion, however, they must have a pentative attitude, and they must say they are sorry, and they must now and then, when they feel they wish to, and feel emotionally and mentally capable of speaking about it, they can talk with their friends who they are sexaling with, and with others who wish to listen as well, and they can denounce the Lesbianists by telling people about the things the Lesbianists do, and did.

If they decide to do this, this is the same as surrendering, and my kids will protect them from other Lesbianists who might want to harm them. They have not sworn in, as a citizen of my and my kids' country, and as citizens of our country that every one is swearing in to as citizens, but it is sort of a promise to swear in, informal gesture that they are committed to, once they begin sexaling with their friends, and with other Lesbianists, who also wish to sexal and in time, denounce the Lesbianists with them.

Citizens By Proxy

By denouncing the Lesbianists organization, and by telling people about what the Lesbianists do and did, they are essentially stating they are sorry for what has happened, and that is a pentative attitude, and with that pentative attitude, they are accepted as citizens, by proxy.

Temporary Full Time Citizens

Citizens by proxy means they are accepted by my kids as pentative persons, who wish to join our country, and who there with, qualify as citizens of our country, in an informal manner. Citizen by proxy means, they give up their old citizen ship, to whatever government they used to belong to, and they are taken in, as temporary full time citizens.

Temporary full time citizen is a term that means they are full time citizens, but on a temporary committal agreement, and that will be made permanent when they have the chance to meet with my children, and

then can swear in, as a permanent full time citizen.

They can then participate at the collection site, in the activities that will be going on, with others, who wish to participate, as they spill their juices, and purify the area with their sexaling juices.

What To Do About Untimely Pregnancies, Health Issues, Medicines, And Regroverative Formulas

My kids will deliver to them, to the men and to the women who surrender and become citizens by proxy, and temporary full time citizens, the needed medications that will help to make their bodies, wholesome and well, and regroverated, as well as the medications that are needed to prevent untimely pregnancies.

Medical And Housing Benefits, And Other Health And Work Related Benefits

My kids will make certain that they will be given the right medications, and my kids will also provide all the same medications for each individual who participates in the collection site activities to purify the area where we will one day set up my ministry with my kids assistance. My kids will also set up other facilities, as well as the ministry facilities. The other facilities will be scattered through out the valley, and they will be the houseing units and other facilities for people to use to become physically fit, well, and well nourished, and healthy, such as gyms, aerobic studios for practicing aerobic dance, and aerobic excercises, as well as sauna and health spa, and swimming, tennis, badminton, cricket, and other sports facilities for baseball, rugby, foot ball, for those who wish to play a friendly game of foot ball, now and then, with the needed bleachers, lighting, and other supportive facilities for allowing persons to attend and watch the games that are going on, not only for foot ball, or for base ball, but also for tennis, soccer, rugby, and all out door sports facilities that will be needed.

When will my kids set up these facilities? They will set them up at the same time or shortly there after, as my kids begin to set up my ministry facilities, and the needed facilities for living and working in the valley area, sexaling for a living.

At that time, the citizens by proxy, and all other persons who have not yet sworn in, but wish to, will have the opportunity to swear in, and then they can enter and use the facilities full time, twenty four hours a day, without any further discussion about it.

All people who participate in the collection site activities, are also citizens by proxy, and as such, will automatically qualify for all medicines, all health supportive medical formulas, and all youthfulness prolonging, or regroverative formulas, that will feed all the amoebes, and other cells, or living beings in your bodies, and that will feed all the living beings in your bodies, that will then allow you to enjoy full regroveration of your body and rejuvenation of

your youthfulness, youthful energies, and of all the other health benefits that accompany a youthful body, such as more energy, a stronger libido, a more healthful body, and so on.

When do people begin this participation in the collection site activities? As soon as they come out here, to Las Vegas, and arrive in their camper trailers, or caravan buses, or other vehicles, or with their camping gear such as tents, and cooking grills, and so forth.

When Can People Begin To Come So As To Be Able To Participate?

How soon can people begin coming to participate at the collection site in the activities that will be on going at the collection site for some time to come?

They can begin coming to participate any time. My kids will watch out for the safety of all the people who come to participate in the collection site activities. My kids will prevent accidents such as current Lesbianists shooting at people at the collection site, from high rise towers, scaffolding, tall cranes, or from hotel and casino properties owned by the Lesbianists, and from other tall condominium and also from tall apartments buildings and also from normal sized, two or three storey, to eight or so stories, apartment buildings, in the area. Of course, my kids will prevent accidents from happening such as shootings, from all possible locations, and not just from those named structures and locations.

Sniper Points, Places Where Snipers Shoot From

There is no need to blow or destroy them with explosives, in Las Vegas, as there will be no way any one can use those hotels, and other structures, as shooting or sniper points, places where snipers shoot from, to harm any one who is participating at the collection site, in the collection site activities.

In time, every thing will be worked out, and all the people who must hand over their companies, or disolve their companies, and sell or get rid of the assets of their companies, all of that will be in compliance with my childrens' instructions with regards to it, as I've stated about it, already, in brief.

Once the facilities are set up by my kids, and people swear in formally, then my kids can begin to pay people their earned income, for the work they did as they sexal for a living, and for their work, as they spill their fluids, to purify the collection site, the collection site area, and the general vicinity.

Pocket Knives, Construction Tools, And Miscellaneous Daily Life Management Tools And Equipment

No one needs to bring weapons to the collection site area, or to Las Vegas, as they will not be needed, and pocket knifes are okay, and construction tools are okay, but they will be for daily use

activities, only. Daily life management tools are forks, knives, spoons, chopsticks, plates, dishes, glasses, coffee cups, can openers, bottle openers, cork pullers, and these types of things, as well as all the other types of kitchen use tools for cooking food, for eating food, for drinking beverages, and for the collection of garbage, and food wastes, and for cleaning up their eating and cooking utensils, such as portable wash basins, and portable gas stoves, or fixed stoves, fixed wash basins, fixed showers in camper trailors, and in caravan buses, and so forth.

Hookups For Travel Camping Vans And Similar Vehicles

We have no hookups at the site, for water supply, electricity, or sewage, as yet, but the instructions that my kids will make available to persons who come in to my kids' underground facilities - the protected and encapsulated living environment - those persons who go in to recieve the instructions, and other information they must recieve on companies and assets, and persons moving on, and on persons staying, and other information needed to successfully carry out the removal of hotels, and the demolition of buildings, etc. which my kids will handle with the technologies they have available to them for their use for these purposes, and for other purposes.

Cleaning Up The Area And Throwing Away The Garbage

My kids will also handle the required steps for clearing up of the litter and garbage in the area, all of Las Vegas, Pahrump, Henderson, Laughlin, Mesquite, North Las Vegas, Arizona, New Mexico, California, Utah, and beyond, above ground and below ground, and for cleaning up the areas, and for removing the underground and above ground garbage, or city buildings and Lesbianists' structures, and all structures that are no longer needed, train tracks, airports, roadways, bridges, parks, hospitals, medical clinics, and so on, all of which will no longer be needed.

Schedule For Leveling Of The Ground And Hills In The Area, Removal Of Unsightly And Smelly Garbage

Initial leveling of the grounds' areas, leveling of the uneven surface areas, and leveling of the sloping areas, and of the tiny hills, and other uneven and unuseful features to the area, such as hills, low cliffs, and removal of unsightly, smelly garbage, will be done by my kids, with the technologies they have available to them, according to the schedule for making these types of changes, and cleaning up of the area, so as to make the area, one hundred percent, useable for collection site activities, for people to then come in and use the area as a collection site.

Setting Up New Facilities

My kids will take care of all of that, and they will take care of all of the work and tasks for setting up a private collection site area - for spilling purifying sexaling juices, to purify the area - in

accordance with my kids' schedule for these works and tasks for setting up a private collection site area, with tall side walls, and barricade walls, to prevent people from rubber necking as they drive by, so as to prevent car, truck, automobile, motorbike, and bicyle accidents. My kids will also set up the latrines, and other needed hygenics facilities, sleeping accomodations, eating facilities, rehydration facilities, co-opted bathing facilities, sports and excercises facilities, and other facilities.

Co-opted facilities means facilities used co-optively by men, boys, women and girls. Co-optively means, in cooperating measures with each other. Cooperating measures means, each of the four groups of people, men, boys, women, and girls, will work together, to keep the facilities sanitary, clean and healthful, neat and tidy, and safe for use, keeping young children from playing on the stairs for the elevated latrines, and keeping young children from getting in the way of asscending and descending users of the co-optively, or cooptively managed facilities.

Fountains And Showering Lamponeers

My kids will also use their high tech teletransportation technologies for removing toddlers from the stairs, and for placing them in a much safer location, such as in a near by sand garden, or play area, with sandy areas, and with toys to play with, and with cold showers, or showering fountains, people can refresh themselves under, and with fresh water to drink.

Lamponeers are showers that shoot up from sprinkler systems embedded in the paved surfaces, or concrete like surfaces, that shower water up and over the area, up and above and over persons who are there, to cool every one off.

Restaraunts, Clubs, Lounges, Eateries, Cafeterias, Bars, Pubs, Bicyle Paths, And So Forth

Bicycle paths, mini bike paths, walking paths, with rest stations, for refreshments and food, will be set up, and restaraunts and other facilities will be set up, nearby and they will be accessable by following these foot paths, bicyle paths, waling paths, and so forth.

All needed facilities for all parties, such as accomodations, living quarters, health clinics, excerize facilties, swimming pools, saunas, spas, and clubs for eating and mingling with persons, either in light weight evening wear and garments, or partially naked, or in the buff, will also be set up by my children for the use by all legitimate collection site participants. Gurkian Laws apply, and no other laws, such as local area laws, will be enforcable. Police and others will be turned away, and the rights of participants at the collection site area, will be protected one hundred percent, as we begin to change over to the new Gurkian Laws we will all be living by, from now on.

Dealing With Criminally Minded Persons

Any violators of the Gurkian Laws, codes, statutes, and so forth, my kids will arrest, and detain, and then place into prison cells, and then sentence them, in accordance with the sentencing requirements under Gurkian Laws, etc., and they may end up doing humiliatory punishments, or community clean up activities. In any case, they will be arrested by my children, who will use their high tech, biometrics and teletransportation technologies, and their other integrated technologies that they have, to swiftly remove the violators of Gurkian Laws, from the collection site and from the collection site area, and vicinity, and that will effectively cancel out their participation, until sentencing has been given, and until penalties have been leaned.

Penalties have been leaned, means, they have undergone sentencing, and the penalties have been enforced upon the violators, i.e., the guilty parties.

Alterations, Modifications, Changes, Clearing Up And Removal Of Garbage In The Areas, And Additions Time Schedules

These modifications, alterations, changes, and additions, etc., will occur over a period of time, as my kids have a schedule for all of these changes, modifications, alterations, clean up, and additions, etc., and they must stick to the schedule, so after you arrive, if you do not see some thing you feel should be there, by then, it is not there because it is not on the priorities facilities and priorities changes, etc., schedules lists.

Texas requires cancer vaccine for girls

By LIZ AUSTIN PETERSON, Associated Press Writer

AUSTIN, Texas - Bypassing the Legislature, Republican Gov. Rick Perry signed an order Friday making Texas the first state to require that schoolgirls get vaccinated against the sexually transmitted virus that causes cervical cancer.
ADVERTISEMENT

By issuing an executive order, Perry apparently sidesteps opposition in the Legislature from conservatives and parents' rights groups who fear such a requirement would condone premarital sex and interfere with the way parents raise their children.

Beginning in September 2008, girls entering the sixth grade - meaning, generally, girls ages 11 and 12 - will have to get Gardasil, Merck & Co.'s new vaccine against strains of the human papillomavirus, or HPV.

Perry, a conservative Christian who opposes abortion and stem-cell research using embryonic cells, counts on the religious right for his political base. But he has said the cervical cancer vaccine is no different from the one that protects children against polio.

"The HPV vaccine provides us with an incredible opportunity to effectively target and prevent cervical cancer," Perry said in announcing the order.

"If there are diseases in our society that are going to cost us large amounts of money, it just makes good economic sense, not to mention the health and well-being of these individuals to have those vaccines available," he said.

Merck is bankrolling efforts to pass state laws across the country mandating Gardasil for girls as young as 11 or 12. It doubled its lobbying budget in Texas and has funneled money through Women in Government, an advocacy group made up of female state legislators around the country.

Perry has several ties to Merck and Women in Government. One of the drug company's three lobbyists in Texas is Mike Toomey, Perry's former chief of staff. His current chief of staff's mother-in-law, Texas Republican state Rep. Dianne White Delisi, is a state director for Women in Government.

Perry also received $6,000 from Merck's political action committee during his re-election campaign.

Texas allows parents to opt out of inoculations by filing an affidavit objecting to the vaccine on religious or philosophical reasons. Even with such provisions, however, conservative groups say such requirements interfere with parents' rights to make medical decisions for their children.

The federal government approved Gardasil in June, and a government advisory panel has recommended that all girls get the shots at 11 and 12, before they are likely to be sexually active.

The New Jersey-based drug company could generate billions in sales if Gardasil - at $360 for the three-shot regimen - were made mandatory across the country. Most insurance companies now cover the vaccine, which has been shown to have no serious side effects.

Merck spokeswoman Janet Skidmore would not say how much the company is spending on lobbyists or how much it has donated to Women in Government. Susan Crosby, the group's president, also declined to specify how much the drug company gave.

A top official from Merck's vaccine division sits on Women in Government's business council, and many of the bills around the

country have been introduced by members of Women in Government.

Morals For A Sane Society - It Is Now Time To Destroy The Lesbianists - Destroying The White House, Balitimore, Maryland, And Virginia, Killing The President Of The United States, Mr. George Walker Bush, Jr., And Sinking The Eastern Coastline Of The United States Into The Atlantic Ocean - Chaos Every Where In My Universe - Bringing An End To The Chaos In My Universe - Surrendering And Repentance - Lesbianists With Non Repenentant Attitudes Who Will Not Surrender - Orders To Kill All Presdential Candidates, Etc. - New Coins Ready And Are The Ever Useful To Us! - Public Nudity And Public Sexaling - What Does The New Moralicity Mean, In Plain Language? Sexaling Is An Absolute 'Good' And An Aboslute 'Right' - Free Action Sexaling Updated: 13-02-07 Rev.a. 00.a PST 23:25

Morals For A Sane Society

To not fuck a person when you can fuck a person is a wicked act.

Not to fuck a man or a woman in the mouthal hole, or in the buttal hole, or to not fuck a woman in the vaginal hole, when you can, and when you are healthy, and when you have the time for it, by refusing, for what ever reason, other than mental illness, or 'gayist' reasons, you are committing a cheap and wicked act, when you refuse to fuck the other person, and use your dick, or your tounge to felate or kiss and tickle, and lick at the ladies' groinal area, and her vaginal cleavage, and vaginal flaps, or labial flaps, or labial tissue, and also her labial throes.

To not suckal a dick or a scrotum or tickle the males' groinal area, with your tounge, or with your fingers, and so forth, when you are able, and ready, and capable, is a cheap and wicked act, whether you are a woman or a man, girl or a boy.

You are given demerit points for not sexaling when you can and are able to sexal, and your time permits it.

To not participate in sexaling when you can participate in sexaling, is a wicked act. To prevent others from sexaling with you, or prevent a person from sexaling with you and your friends, these are both wicked acts.

A kindly and goodly person is a person who sexals all he or she can and who participates in sexaling with people, all he or she can, when ever he or she can to help those people, and one self, to erase the negative karmic markups each person has, and to help to create the wonderful energies that you can create by sexaling, and to change our universe into the nice place we need to change it into for us to live in, prospering with each other, in kindly loving embraces with each other.

If you stand or sit, talking, drinking, eating, with your clothes on, arguing, and discussing football, or baseball, or the local news on TV, or whatever, and you if you are not sexaling, as a result of your actions, when in fact, you could be sexaling, and helping to purify all the people around you, and yourself, as well, you are commiting an evil act, and an immoral act. It is immoral to behave in an uninterested manner, towards sexaling, and towards helping others by sexaling to purify their karmic markups. You are engaging in wicked, unkindly, and evil behavior, by non chalantly staring out the window, at a restaraunt, or in your car, with others around you, thinking about your miscellaneous thoughts, and by your not attempting to purify others, with every ounce of energy you have got, by sexaling with them, in a safe manner.

We do not want you to drive down the road, sexaling, and not paying attention to the traffic, and thereby causing accidents, and there be causeing harm and injury to self and to others, thereby preventing one self and others from their being able to freely mobilate, or move around freely, or ambulate, as they say in modern English, and then freely participate in sexalating activities of fucking, sucking, tounging, massaging the bodies, and the titties, and buttholes of women and girls, and massaging their kissing lips, and their vaginal lips, their facial cheeks, and their butt cheeks, and so forth. You must drive safely, and make it home, to a safe place, where you and your friends can freely sexalate with each other, without others interefereing with you.

A wicked or evil person is one who prevents a person from sexaling, and who destroys or ruins another person, physically, mentally, morally, emotionally, psychologically, or psychically, so that the other person can not participate freely and fully in holy and pure, GODLY sexaling activities.

This type of person who prevents others is a ruinous person, who will invite ruin and disaster to his or her doorsteps, and into his or her life.

There are many ruinous people, who execute others, and who torture, and cause pain, and suffering to others, and who disfigures others. These people who execute others, and who terminate their ability to sexal, prospering with others, making our universe into the kind of nice place we all want to be living in, together with each other, are wicked and evil people.

It Is Now Time To Destroy The Lesbianists

However, when we have a problem of the size and the magnitude of the Lesbianists, that we have, today, in this period of chaos, across my universe, and the Lesbianists' who are toying with humanity, and with all human beings who are not Lesbianists, it is time for us to take action, to prevent them from toying with us, and put a stop to their amusing themselves with their toying with us, any further, and it is now time to destroy them.

"I am Arjuna, a wickedly angry man, and I come to protect those who can not protect themselves. I will kill and thrust my sword and lance through the hearts of men and women who evilly try to prevent people from being prosperously good and bekindly to others."

This is a stanza or sentence from one of my writings, of old. 'Wickedly angry' in this sentence means, outraged, and furious, so much so, every one is scared and afraid of me.

I am 'wickedly angry' and I am here 'to destroy' those who would fuck us up, and ruin our lives, and make our lives miserable, as they toy with us.

My name is GOd, but in my Buddhist scriptures, I am referred to by many names. One of my many names, as I appear to people, in many and various personas, is Arjuna.

I have many sides to my character, as I am GOD, and I am here to protect my children, no matter what the name is people use to refer to me by, and that I am known by, and no matter how it is and no matter who it is among my many children, who I will protect from wicked and ruinous people.

Destroying The White House, Balitimore, Maryland, And Virginia, Killing The President Of The United States, Mr. George Walker Bush, Jr., And Sinking The Eastern Coastline Of The United States Into The Atlantic Ocean

There will not be any further Lesbianists living in Washington DC, or in Baltimore Maryland, or in Northern Virginia, and that vicinity, above ground, and below ground, if some one will be so kind as to place a very large explosives, fuels, chlorine, high heat burning metals fragments, and fracturable rocks bomb, outside the gates to the Washington DC White House, where the number one enemy, Mr. George Walker Bush, Jr., President of the United States, lives, and works, and then detonates that bomb, out side the gates of the White House, where the president lives, currently, and then destroys him, and his

White House, a lair for Lesbianists, with multitudes of torture rooms, i.e, lots of them, below and inside of the White House.

You will destroy and kill the President of the United States, Mr. George Walker Bush, Jr., and Mrs. Barbara Bush, Jr. and every one else who lives at 1600 Pennsylvania Ave. Washington DC.

Why are we going to throw all these people into my Epcot Center. Once in my Epcot Center, they can freely sexal with each other and they can earn merit points.

That will help them straighten out their karma, and it will help them to have a nicer life, when they are born as tummy babies. There are many tummy mommies who will match up with these people, and when they come out as tummy babies, they can start their life, with us, out here in my universe with us, again.

Am I a wicked wrongful person for terminating so many people's lifes? No. Why not? Because that is the only way we can over throw the vastly wicked and evil Lesbianists who practically rule my universe, with their perverse friends, and there are many groups of perverse friends, who we are going to get rid of, and send into my Epcot Center, one after another, as we move ahead, in our efforts to clean up our universe, and in our efforts to stop this nonsense of senseless killings and torturings of people, for amusement, and for game playing.

The Washington White House is one of the homes for these perverse people who game play and toy with all human beings who are not Lesbianists, who live on this planet.

We have many Lesbianists to trash, and to say good bye to, before we can begin to get our world, straightened out, and started up again, with a new culture, with new morals.

We will throw out their old cultures, their Lesbianistic cultures, and we will replace them with our new culture, and our new civilization, that is based on my religion, and on the sanctity of sexaling as a common sense value.

Sexaling is a sacred and holy act. Even if you sexal with a kangaroo, or a chimp, it is still a sacred and holy act.

Why is that? It is because every body is made of something, and that something comes from me, GOD. That something from me, is pure and holy, as I am pure and holy. I designed every person, and every animal, and every living being, with sexaling capabilities that allow that pure and holy GODLYNESS to come out once they begin sexaling.

That GODLYNESS begins to radiate out, as each person begins sexaing, and as each animal begins sexaling, and as each living being begins sexaling, eroteming, orgasming, and phlumetting, and it purifies each and every living being, and washes away the karmic markups every

person, and every animal, and every living being, has in them, and has stored in the molecules that are stacked up in my universe, out side the boundarary walls that hold this universe up, and that keep us in side of the area we are in, and that keep the rest of my universe standing up, stable, making this a safe place to live, at least, safe in so far as nothing comes crashing down on us.

My kids are expert builders, and it is thanks to them, that we have such a nice and safe, and well built universe to live in. It is also thanks to them, that we have these bodies to live in, and to sexal with, since my kids put us together, one molecule at a time, as we need to have our parts put together, along with all the anmials, and living beings, who are inside of us, that my children also assemble for me, and for us.

What is this GODLYNESS? It is a purifying force, that is of me, and is me. It is inside of every one, and inside of every creature, animal, and living being, in my creation.

This is woven into the fabric of your being, and it is of me, and is always a part of me, and is always connected to me. Since I am always pure, and GODLY, you have a possibility of becomeing pure, and holy, like me.

Right now, we are filthy, and grimey, and all gunked up, with sludge, and residues of our karmic heritage. We have done many things that contribute to who we are, and to what we experience, day to day, and if we are not happy with our life, that is because we have the karmic records and markups that dictate that we must be in this miserable and suffering condition, that we are in, today.

There is always sufferring, and unwholesomeness, in our lives, and around us, every day. There are many wicked things that go on, every day. People perpetrate wicked acts, daily, and they go on, unpunished, for a long time, until their karmic markups begin to add up to sufferings coming out, in that person's life.

Sufferings are your payback for your wicked acts, and they help to keep our universe in balance, as I've spoken about, a little, before.

It may seem unwholesome that I ask you to kill my kids, and put them into my Epcot Center, where they can sexal, and where they can get retrained, and where they can be taught to be nice people, after they are retrained, but my asking you to kill my kids, this is merely an expedient, or a means to an end, and it is permissable, given the circumstances, and given the situation, and given that we are at the begining of our new Age of Gurkian Englightenment.

The result we wish to see by killing them, is an end to the activities of the Lesbianists, and and end to the activities of other people like them, in my universe. The Lesbianists are ruining my universe, and ruining the lives of every body in my universe, and though this was the way things were balanced out, prior to now, we are starting out,

with a new method of 'payback' and a new means to balance out the karmic balance book. This is all to be governed by my rules and regulations, that my kids will enforce, in our new, Gurkian Age of Enlightenment, begining about now.

Our killing the Lesbianists, will help to control their ruinous and heinous behavior and activities, and it will help us to get them out of the picture for a while, until we are able to set up our new government, globally, or universal wide, across our universe, in a one universe government, over seeing the activities of all of my kids. It is the only way we have to begin to get our selves straightened out, and onto our new path, that we will follow, for the rest of eternity.

This marks the begining of the Gurkian Age of Engligtenment, and it marks the end of the previous period, or random, or just about nearly random, chaos.

We went through a very long period of decline, untill we got to the period of chaos that we are in, now. This period of chaos, we call, the 'melt down' period.

The 'melt down' period, came after the 'run amuck' period, when my kids began their severely ruinous activities that led to the period of chaos that we are now in.

Chaos Every Where In My Universe

We are going to begin to pull ourselves out of this period of chaos, with the help of my religion, and with our religious activities, and it is going to take us a very long time to pull ourselves out of it, as this 'chaos' is going on every where in my universe.

It will take us a long time to begin to be able to erase our karma enough, based on my religious principals, and the ethics of the Gurkian Age of Englightenment, and our religious activities of sexaling, dancing and excercising, and sexaling in syncopation with the metronome, at one thirty seventh and one fifth, or so, to then some day be able to have erased enough karma, to be rid of, completely, all these horribalistic people, my horribalistic kids, in my universe. When I say, be rid of them, I'm not saying, to trash them, completely. I am saying, we will put a stop to their activities, by changing our karma, and by purifying ourselves with my religion and our religious activities of sexaling, keeping time, in synch with my children, as we sexal, and as we activiate, playing basketball, tennis, or as we swim, or as we pray Nam Myeo Ho Ren Ge Kyeo, and so forth.

Bringing An End To The Chaos In My Universe

We are going to bring an end to the chaos, and to the chaotic behavior, and abberant, ruinous behavior in our universe, as we bring this period of chaos to a close. We will, as we steadily move forward, open the way for the budding and flowering of the Gurkian Age of

Enlightenment, and to the budding and flowering of the new age of friendship and loving care, among all of my children, who participate in my religious, social, economic, and karmic revolution, as we sexal with each other, lovingly, and strive to clearify and erase our karmic markups, sexaling, and synching our activities to one thirty seventh and one fifth on the metronome. Later we will fix our metronomes to keep exact pace in synch with my children, and after we fix and reset the timing scale of the metronome, the timing will be one thirty seventh, exactly, on the metronome.

Our sexaling will produce all types of wonderful, purifying energies, that will revive our universe, and that will revive us, and that will help us to reclaim our universe, and that will help us to live, prosperously, and prosperingly in our universe, together, with each other, and with every one of my children, as we reform the bad and naughty ones, who are wicked and unkind to others, and who prevent people from sexaling, together, with each other.

That means, we are going to kill all the bible thumpers, Pat Robertson, Orwell Roberts, Billy Grahm, Tammy Faye, Jim Faye, and all the other Lesbianists of every religious faction, or group, whether they are Lesbianists who are christians, islamists, judaists, shiites, hindus, buddhists, black moslems i.e., afro american black muslims, or whatever.

We are going to destroy them all, all who would try to prevent us from what we are attempting to accomplish, a global, universal wide, government, run by me, GOD/GOd, as I am the Captain of this ship, and then we are going to begin our new age of Enlightenment, hand in hand with each other, and when they come out of my Epcot Center, again, next time, to be born as tummy babies, to tummy mommies, and to tummy daddies, we will teach them the new rules, ethics, and morals of our new universal wide society, and then we will begin again with them, and raise them in accordance with the new rules, laws, regulations, ethics, and morals of our Gurkian Age of Enlightenment, led by me, GOD/GOd.

Surrendering And Repentance

Those who will surrender, will be allowed to be repentantent, and they will be forgiven for their misgiven, misbegotten, and ill minded ways, once they begin sexaling with the rest of us, and participating in our religious, economic, and social revolution, and once they begin following Gurkian laws, rules, ethics, the codes and norms of behavior, and our righteous, and correct morals, acting and exerting one's efforts for the sake of others, never sparing a moment of energies, wastefully on trivial and trite activities of gossipping, mischiefing, or other harmful, and potentially ruinous, wicked, and evil behavior.

Lesbianists With Non Repenentant Attitudes Who Will Not Surrender

Those who will not surrender, we will send to my Epcot Center, as that is the only way we can get them out of the picture, temporairily, so that we can then get things in order, before they return, once again, as tummy babies, into the lives of tummy mommies, and tummy daddies.

Orders To Kill All Presdential Candidates, Etc.

You are hereby authorized by me, GOD, John Francis Ayres, to kill all United States Presdential candidates, including but not limited to, Barack Obama, Hillary Clinton, and Mitt Romney. They are to be executed on sight. Also, you are ordered to kill all non repentent Lesbianists, such as, Vice President Dick Cheney, Tony Blair, Butros Gauley, Oliver North, Colin Powell, Oliver Poindexter, Casper Willard Weinberger, United States Supreme Court Chief Justice John Roberts, Associate Justices, John Paul Stevens, Anthony Kennedy, David Souter, Clarence Thomas, Ruth Bader Ginsburg, Stephen Breyer, Samuel Alito, Antonin Gregory Scalia, Arnold Swarzneggar, Sylvestor Stallone, Robert Deniro, Gary Busey, Kevin Sorbo, Timothy Dalton, Michael Jackson, Matt Damon, Bruce Willis, Mila Jovovich, Peter Jennings, all members of the United States Congress who are Lesbianists, and all other Lesbianists, whether in politics or not, and in whatever government you find them, around the world. There are many Lesbianists in local and metropolitan police departments, and in SWAT Team units, and in fire departments, and in the National Guard units throughout the United States, and Lesbianists own every news media organization, television corporation, cable television corporation, satelite television corporation, major radio station, transportation corporation, chemicals corporation, petroleum corporation, coal mining corporation, as well as every other major corporation around the world. You are to kill every last one of them, and spare no one. We will then destroy every underground city they are hiding in, and force them to surrender. If not, we will kill them all, and I authorize you to do exactly that, kill every last one of them, all thirteen billion plus Lesbianists, hiding under the surface of our planet, or out walking about, pretending to be an ordinary citizen on this planet. Nothing is further from the truth, and you are authorized to kill each and every one of them, and send them all to my Epcot Center, using what ever means available, including my tactical, powerful, home made radiological explosives bombs, i.e., nuclear explosives. Please study my notes on my web site for further details regarding radiological fracturable rocks, and my notes on how to make an explosive weapon to detonate nuclear materials, you can find along beach shorelines, in sediments deposits, and on old mountains, every where on our planet, if you have a geiger counter.

New Coins Ready And Are The Ever Useful To Us!

http://money.aol.com/news/articles/_a/new-dollar-coins-enter-circulation-this/20070211095409990001?ncid=NWS00010000000001

"Updated:2007-02-11 15:20:31"
"New Dollar Coins Enter Circulation This Week"
"By WILL LESTER"

"AP"
"WASHINGTON (Feb. 11) - Maybe Susan B. Anthony and Sacagawea should not take public rejection personally. It's not easy overcoming people's indifference to dollar coins, even those honoring such historic figures."

See also,

http://news.yahoo.com/s/ap/20070211/ap_on_bi_ge/money_ap_poll

The new coins reportedly have many fracturable rocks in them, as the metals used, were mined from deposits of minerals that contain large amounts of fracturable rocks.

They also have high heats and high temperatures burning minerals in them, that will level up your thermal temperatures to near solar temperatures, if grinded up and mixed in, and allowed to ferment, in sour berry juices, slowly, with tiny amounts of salt, and large amounts of raw sugar.

The high heat temperatures, and the energies produced at these higher heat levels, will reach near solar heats energies temperatures, and that is very important for developing the energies needed to wake up every body, in the fracturable rocks - or 'fissile' materials, in Lesbianists' speak, or Lesbianists' mumbo jumbo language - to get them to begin making children and families.

Please see my notes on 'Radiological' crystals cages salts kiddies, and other related energical animals kiddies, of various, and hard to imagine, types, unless you're a kid and unless you have the mental flexibilities and typical mental gymnastics capabilities of a normal child, unhindered by brainwashed thinking and brainwashed patterns of thought the Lesbianists have caged, and closeted in the dark, our brains with.

Public Nudity And Public Sexaling

Public nudity and public sexaling is now a way of life for all, in our, now, Gurkian Age of Enlightenment. We will begin broadcasting live sexaling events, and other entertaining and informational, educational programming,, as soon as I get my new quarters, a unit to live in, where I can eat more properly, sleep more properly, recieve the medical health aides and regroverative formulas, that I need, and where I can practice my religious ceremonies, with others, daily.

The public broadcasting of various informational programing, educational programing, sexaling entertainment programing, sexical, hygenical i.e., sexaling hygene, and sexical educational programing as well as sexical training programing, as well as my religious ceremonial sexaling activities, and my general, more typical day to day, religious ceremonialing, for now, until I get my health up to a level of youthful vigor, and robust wellness, as I religiously interact with my students, and train them, the disciple priestesses,

and disciple priests, will all help to set the basis of normative, and expected, social behavior, for all people in our universe, to learn about, now in our Gurkian Age of Enlightenment, so that we can all get along, with one primary set of customs and standard of behavior, and with one primary language for communication, as we will all be sexaling with each other - all of my children who are now just begining to get with the program, at least, anyway, will be sexaling with each other - from now on, and for all eternity.

We need this exposure, as well as alternative programing, for laundering up to, and for begining to expose ourselves to, and learn about, the reality of the universe, my universe, that we live in.

Laundering up to, means, exposing ourselves to the mischievous antics of the Lesbianists, to launder their filthy, garbagical, and tormentuous ways, so that all may learn about them.

This will be coming up, in the near future, possibly, as far as I can determine, any way, after we have the spilling of the sexaling fluids campaign under way for purifying the area where I will be setting up my religious ministry, on the parcel of land, on the north west corner of the intersection at West Tropicana Ave. and South Decature Blud., Las Vegas, Nevada, and possibly on confiscated properties to the north, as well as to the west, for now. This is a public service, informational bulletin, on what you are to expect, in the near future. Prepare yourselves, accordingly.

What Does The New Moralicity Mean, In Plain Language?

Our new moralicity means we are going to learn we can and should sexal with every person, and even with animals, when we have a chance or opportunity to sexal with people and animals, and that we can and should sexal with every person we see, so long as we have a mutual reciprocical understanding of the truth to sexaling, that it is a pure, blessed, and holy act, GOD, me, made possible, to purify you of your blemishes. It is the most significant and powerful way to purify you of your blemishes and karma

You can also clearify your blemishes, your karmic markups, by praying Nam Myeo Ho Ren Ge Kyeo, and by your keeping syncopated and in rythm with my children, helping my children to work smoothly, syncopated and in rythm with each other, perfectly fluxed, meshed perfectly with all my other children, working at different life spins, as I've mentioned about, as my kids will reward you by sprinkling faerie dusts, purifying energies, and other types of related, purifying things and dings, all over you, as a reward for your cooperation in keeping my universe, humming, and running, smoothly.

With your syncopated rythms, your syncopated pace of movement, and actions, as you time your motions, and stay in synch with one thirty seventh on the metronome, plus one fith of a mark on the metronome we currently have available to us, here, on our planet, during your

activitiating, sexaling, playing sports, dancing, excercising, and so forth, you will purify your life, and you will purify the lives of those around you, with your actions, as you get rewarded by my children.

Our new moralicity means we can and should sexal with each and every person possible, in free association with each other, no matter what the age of the person, and no matter what the gender of the person, no matter what the tribal background is, no matter what the tribal heritage is, any place no matter where we are, any time no matter what the time of day or the time of night it is, in public spaces or in private living spaces any and all places, no matter who else is around us, as sexaling is a blessed act that my kids reward you for, any time, every time, no matter where you are sexaling, and no matter with who you are sexaling with, or even no matter what type of animal you are sexaling with.

It means there are no bullshit, propagandists' Lesbianists dreamed up taboos, any longer, regarding sexaling, and that sexaling is a blessed act, and not a 'forbidden' act, as the bullshit Lesbianistic Christians, Muslims, and other religious 'pious' bullshit assholes, who would want us to believe that sexaling is forbidden by 'God', which is complete and total bullshit, and a lie, as they base them selfs on their 'holier than thou' pious 'ignorance' of the truth.

So long as you and the person or persons you are with are equally, mutually, and reciprocally interested in purifying your lifes, and interested in clearifying your karmic markups, and interested in helping my children work in synch with each other, and interested in helping to push my children along, with your energies, and efforts, and so long as you can sexal together with one and each other, without damaging either or any of the participants, it is morally correct behavior, and any person or actions to prevent that morally correct behavior must be condemned, and punished.

Some people, especially young participants, do not have butt holes, mouthal holes, or vaginal holes that are large enough to swallow a dick, or mouthal holes that are large enough to swallow a tittie and suckle it fully, without straining.

You need to spend several hours phlooching out the butt hole, or phlooching out the mouthal hole and throat, and phlooching out the vaginal hole, with generous massage over several hours to the muscles and tendons in the neck, mouth, nose, eye ridges, ears, throat, face, chest, tummy, back, arms, hands, fingers, shoulders, titties, thighs, hips, waist, groinal area, labial folds, vaginal lips, facial lips, male genitals, and the entire torso, back and front, the legs and feet, ankles, and toes, as well, and all parts and areas from head to toes and in between, with continued efforts to massage all these places, until the body begins to respond, and until the body responds fully.

The butthole will loosen up, and the throat hole will loosen, and the mouthal hole will widen, and the vaginal cavity and vaginal mouth will widen and expand in size, and the groin in girls will spread apart, allowing for more room for access to the vagina, and for smoother access to the butthole, as the hips loosen up, and begin to spread apart in response to your efforts at massaging the body, to prepare it for sexaling.

No matter how old a girl is, and in the case of a boy, no matter how old the boy is, baby, child, adolescent, or adult, phlooching out the sexaling orifices, is easy, if you spend the needed time on preparatory and thorough massage, sufficiently enough.

That's how I designed your bodies to respond to massage efforts to loosen up the muscles, ligaments, sinews, cartiladges, so as to allow the bones of the body to move and spread apart, freely, and loosenly. Your body is like a rubber band, and if you massage it, well enough, it will begin to respond like a rubber band, and it will loosen up, and spread apart, where it needs to spread apart, so as to allow you to sexal, thoroughly, and continually, for as long as you continue your sexaling activities.

After you finish your sexaling activities, your body will begin to stiffen up, as all the ligaments, sinews, cartiladges, muscles, and fiberous threads throughout your body, begin to tighten up, for returning to daily life, working activities, where you need a hard, and tough body, to survive, as you work in the field, or work in the rice paddies, or work on the farms, to labor for producing crops for feeding you, your families, your children, relatives, tribal village friends and tribal villages neigbors, who are, or who used to be, traditionally, as life used to evolve for us, all related to all of those concerned in the area, or on the planet, for that matter, or in the entire galaxy, or spread out over many galaxies, and even spread out over even larger, and wider areas of my universe in the large, familiies that used to be the norm.

You may need to spend several hours, or even several days, or maybe even longer, a number of weeks, or even a number of months, before the body will begin to respond, and begin to flex, and bend, to help all the ligaments, sinews, cartiladges, tendons, muscles, and all the body parts, and supporting, interwoven parts of your bodies, as I've briefly talked about, before, as well as all the lubing stations, that will eject fluids to assist in the loosening up of your bodies' ligaments, sinews, cartiladges, tendons, muscles, and even the bones, to allow them to be more flexible, including the jaw bones, facial bones, neck bones, spinal bones, leg bones, thigh bones, hips bones, pelvic bones, buttal bones, groinal bones, back bones, and all the bones of the body. Every bone in your body will loosen up, and become more flexible, and pliant, durile, durable and tensilely strong, as you massage all the parts of your body, and the bodies of the people you are sexaling with, very young, young, adolescent, adult, middle aged, elderly, and even the ancient, or the extremely very old.

This is the truth to this matter, and you can find out for your selves, if you try and see how your bodies respond, to daily, rigorous, continued massage, over various lengths or periods of time.

This is part of the ancient and old art of sexaling, as I taught in my religious teachings, in every religion that I taught, and I have taught a lot of religions in my time, to lots of different peoples in my universe, from the begining of our time, here, together, in our universe, after we arrived, which I've talked a little about, before.

Sexaling Is An Absolute 'Good' And An Aboslute 'Right'

Even the veryest oldest and the veryest youngest have a right, duty, and obligation to sexal and produce holy, sacred, sanctifying, i.e., to make sacred, holy, and pure, harmonious, purifying energies.

It is an 'A B S O L U T E' RIGHT as in, a 'right' to free speech.

It is also an 'A B S O L U T E' RIGHT as in, 'this is right, correct, upstanding, laudable, commendable, proven to be always right, correct, true, holy, graceful or GODlYNESS and GOODLYNESS gracefilled, morally right, morally correct, morally absolutely right, and morally absolutely correct', as opposed to, right and wrong, i.e., as in the opposite of wrong, as in, that is wrong, that is incorrect, evil, hateful, sinful, morally inaccurate, morally wrong, morally defunct, undoable as it will not stand, and useless,'.

It is also an 'A B S O L U T E' GOOD and an 'A B S O L U T E' GOODNESS.

Free Action Sexaling

Anything that counters, or runs contrary to this, is an 'A B S O L U T E' WRONG, and an 'A B S O L U T E' EVIL. It is absolutely wrongful to deny or to prohibit or to interfere with, in any way, with any one who wishes to sexal, as THAT PERSON IS CLEANING UP MY UNIVERSE WITH HIS DICK, OR WITH HER VAGINA, BUTT, AND TITTIES, AND WITH HIS PURIFYING ENERGIES, OR WITH HER PURIFYING ENERGIES! DO YOU UNDERSTAND THAT?

Any body who even attempts to impede, to deny, to prevent, or to interfere with, in any way at all, with a person's absolute right to sexal runs counter to Gurkian laws, regulations, codes, ethics, morals, standards, and you will serve jail or prison time, for prohibiting, or interfering, or impeding, or violating in any way, a person's absolute right to free action sexaling, which is, the act of freely chooseing who one wishes to sexal with. DO YOU UNDERSTAND THAT, SOLDIER? GOOD! BECAUSE A "NO SIR!" WOULD BE INAPPROPRITATE AND UNACCEPTABLE!

To learn more on these subjects, swear in, and become a citizen of our country, and begin studying, and working in the many programs my children have for you to study and work in, to score earning points, and to earn a living in our new, Gurkian Age of Enligtenment, where

and now that we work, and we pay as we go.

Those who refuse to work, in time, will be required to work, to pay off their debts and to pay off the fees that are owed for the use of my resources, all the molecules in my universe, and all the resources, energical, or otherwise.

Even though I am GOD, in our new system of working in my Gurkian Age of Enlightenment, even I have to pay for the resources that I use, as I work as chief priest of my religion, spiritual director of my universe, and boss of my universe.

I'm the mother and father, the creator of all humans, animals, and living beings, as I've explained, every thing in my creation, and people will begin to understand that, that I am GOD, as they practice my religion, over the years, and over the aeons, and over the millenias.

The people who refuse to work, will be required to work in prisons, sexaling with animals, to produce sexaling energies that will restore the supplies of energies in our universe, as I've mentioned about, before, as they work and learn their new trade of animal husbandry, and animal wifery, in the animal habitry industry, as I've also mentioned about, in earlier notes.

No matter what the age of the person, every person can participate in our Gurkian Age Of Enlightenment, sexaling, dancing, excercising, and syncopating their movements, in rythm, to assist my kids as my kids, work to keep my universe, strong, durile, flexible, safe, and a nice place for every one to live in.

DO YOU UNDERSTAND THAT? YOU HAD BETTER, AS A "NO SIR!" WOULD BE UNACCEPTABLE, SOLDIER! DO YOU HEAR ME? I HOPE YOU DO! NOW, GET TO WORK AND SEXAL TILL YOU DROP, SOLDIER, AND I'M NOT JOKING!

We will build a nice and comfortable, safe place for every one to live, now, in my universe, and we will follow the Gurkian Age of Enlightenment Rules and Regulations, Codes, Morals, Ethics, and behavioral norms, that you are required to live by, now that we are going to become, one, very big, happy, harmonious, in synch, prospering family.

You will not forget to wash out your butty butt holes, and to flush out your vaginas, and your mouths, and to practice proper and health promoting sexaling and love making hygene, with the medical formulas that my children will be providing to you, and that you will pay for, out of your earnings, and they are very reasonably priced, now that I am making every thing available to every one, at a set, yet, flexible, and low cost for the use of my resources, once you citizenize your selfs, and swear in, as a citizen of our new, global, i.e., universal wide, one universe, family of GOD's, that's me, children.

The costs are flexible, in the sense that you do not have to pay, yet, as you will be learning about the ways to work, and you will be learing and preparing your selfs for a new working life, in my universe, for some time, and so we have no hurry to have you pay for the resources you use. We can collect the fees, and costs for resources, in the future, when you are a big money earner, once you learn your new work requirements, for sexaling for a living, as that is the only job opportunity open to every one, and the only job opportunity, that you have a choice about.

My working children, though they do have many different jobs, they have basically the same set up, or arrangements as you now will have, and so you will be joining my children, and you will be working, i.e., sexaling, excercising, aerobically dancing, and so forth, in synch, and in rythm, for me, just as all of my children are doing, at least, those of my children who are able to work, and who are bright and intelligent enough to work for me, to keep my universe, healthy, safe, solid, durile, strong, wholesome, and a nice place to live in.

That means, I have a lot of burnouts kids, and rampant, vagarous, dangerous children, who are not really very bright, and they do not work for me, yet, but they will, in time, regardless of the fact that they may at the present, be abominants kids, or not.

As I've mentioned, all my up until now, non working children, are abominants. What does that mean? It means, they do not give a darn about killing another person. They kill for selfish reasons, and for fun and games, and so forth, and you are all guilty of that, though you may not remember that you killed for fun and games, and for selfish reasons, in previous lifes, in my universe, but you all have, and you are all abominants, of varying degrees.

So, welcome to the Gurkian Age of Enlightenment, and welcome to my workforce.

Captain Off The Bridge.

>the garbage. I suspect the whole newsgroup concept would be improved if
>cross posting were automatically eliminated.

Moderation software can be written to set a limit for crossposting.

Individual users can write their own filters to killfile
crossposts automatically.

>(I notice this message is
>being cross posted !)

Yes. Crossposting has been a standard tool in discussions of
RFDs for a long time. The idea is to let folks in affected
or interested groups find out what is going on as well as
collecting the discussion in a central thread where it is
easily accessible.

It may be a source of annoyance to some in the crossposted
groups. If the subject line is preserved, folks who do not
want to see the discussion can killfile the thread by its
subject line.

Another tool is to use the "followup" header to redirect
replies to a single newsgroup. That can cause troubles, too,
especially for unwary respondents who do not know that their
replies may be going to an entirely different newsgroup.

It was ELNEC for me and EZNEC continues the trend
of very powerful but inexpensive modeling software.
I have probably learned more from ELNEC/EZNEC than
from any antenna book.

Early color TV sets used a coaxial cable delay line for the luminance (B&W signal) component, since the chromanance (color signal) is delayed in the circuits that process it but they both need to arrive at the picture tube simultaneously. Newer sets use various means besides a length of coax.

1461. Aprspoint 4.2 released!

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-16 16:46:21 UTC
From: "hxc98@yahoo.com" <hxc98@yahoo.com>
Message-ID: <1171644381.004509.116900@p10g2000cwp.googlegroups.com>
Source record: 45872

APRSPoint 4.2 is uploaded,

1. This new version has improved tracking support by adding separate track lists for stations to be tracked over either RF or TCP link.

2.It also added a new reject field in the filter dialog, where you can specify a list of stations to filter out using multiple strings that can contain wild card characters.

3. It allows you to selectively remove stations from the tree view list. This combined with improved filter operation, enables you to dynamically adjust what gets displayed on the map.

Please visit http://www.aprspoint.com for details and download.

Thanks, Michael KF6ZDM

Hi Black

I like EZNEC because it works very well, it is very affordable, it is
supported by an extremely good technical guy, it is easy to use, there is
alot of ARRL/HAM instructions available, it will produce circularly
polarized plots. AND, it is Affordable.
I also assume that *if* you were a professional, looking for advice on a

program for antenna modeling, you wouldnt be asking on this "HAM related news group".

Richard, I dare say that the 3 meter limit, and the horrible mismatch achieved with such an antenna just might be part of the whole idea of part 15 transmission. The user isn't supposed to put much of a signal on the air. It's supposed to be a technically poor setup.

Of course, assuming that the science fair is taking place in a school building, the student could operate as a campus transmitter. Lots of extra steps and paperwork there though.

> Would a loop perform better? What dimensions? How to build the

Seems like a good way to go for the kid would be to buy a kit or better, build a radio from scratch, keeping within the legal limits.

Asking for help in here can be confusing enough for a new Ham, let alone a young schoolkid.

This is normally what I do at a new QTH if I have the room. I try for at least 40m of wire center-fed (though I can get by with about 30 if I'm squeezed). And I just feed it with ladder line and a balanced tuner.

If it can be mounted as a sloper favouring a desired DX direction, so much the better. Horizontal, it's good for NVIS on 160, 80 and 40.

If you run into OH8OS on the air, tell him hello from me. We used to QSO on 15m a lot in 1965 when I was an operator at VE8ML.

Bob,
Thank you for esponding to my questions, and apologis for my
delay in responding.

GDOs have their limitation as the coupling between the
oscillator and resonant circuit
causes the frequency to be pulled - a GDO with a frequency counter
might be a very useful instrument.

My main question about the use of a GDO is how high in
frequency can a practical GDO get
to in frequency and still oscillate, couple to a similar frequency
resonant system and be able to observe a
"dip".
Your advice on coupling and matching to the antenna are
excellent help, what I didn't understand
was the impedence value at the folded driven element. Probably
something from long ago, but I believed the
impedence of a folded element was 300 ohms???

Could you please explain what you meant by :-

>"or maybe increase the number of
> driven elements folded dipole style to get the Z up to 200 ohms. A yagi
> feedpoint Z is going to be maybe 10-20r. One extra driven element
> (simple folded dipole) will multiply that by 4 and a third element
> another 4 times."

In physical term I don't know what this means.

An article that caught my attention recently that I will share
with you is a cheap method
for measuring complex impedance, it is at:-
http://web.ukonline.co.uk/g3ldo/aegextra.htm

Once more thanks for your help.

Regards,
Ian

Hi Ian

If you get serious about building a device for measuring the complex impedance of circuits at VHF / UHF, I have some recent experience I'd share with you.
The problem with "Home Made" seems to be very difficult to get acurate data with when the load impedance is close to matching the Zo of the "Impedance Meter". For measuring complex impedances that present a VSWR of 2:1 or greater, a home made slotted line works quite well.

Hello Black Sheep,

There is a program called "WireGrid for windows", it is from the
company that also makes the (expensive) FEKO package (South African,
EMSS). It was for some time on their server for free (but without any
warranty and support). It is no longer on their server (I checked
it). If you like, I can mail it to you (3900kB).

Wiregrid is a NEC pre- and post processor (with NEC2 files included), with a very reasonable interface with instant 3D structure view. You can enter wires and polygons that can be meshed automatically with predetermined wire diameter and grid size.

I like this program because you can enter polygons (for example for generating a finite ground plane) and the 3D viewer is really good.

Best Regards,

Wim

Hello Art,

If you main the rotation of polarization of a wave during transit in a
DC magnetized medium, it is NO for NEC2. I do not believe that it is
modeled in NEC4.

Best Regards,

Wim

1481. Trimming 2m 5/8 wave antenna for 156 mhz ???

Hello ! I just bought a 2m Hamstick antenna at the Orlando Hamfest, the model 9100. I would like to trim this antenna for 156 mhz, for marine use on my boat. Can someone tell me "about" how much I should shorten the whip to achieve this ? Remember, this is the 5/8 wave antenna with a loaded base.

Thank you very much !!

Hi all,

I've been away from ham radio for quite some time, and I am looking to get my ht up and running. I want to make a J-pole.

Although I have found some plans to do so, I was looking more for the science behind it.

I see that the stub is 1/4 wave and the other side is 1/2 or 3/4.

I forget the formula to find the wavelength. Was it the freq divided by 468 or 234?

any help would be great.

IRRC the Hamstick is a quarter wave antenna and requires a counterpoise
to operate correctly. You would be better off getting a marine 1/2 wave
antenna for you boat as most fiberglass boats do not have enough metal
to provide the counterpoise.

Dave, as stated in my OP, this is a 5/8 wave antenna. It is the antenna that I have bought and that I will use temporarily. This will be for a very temporary use, and I agree with your suggestion about a marine 1/2 wave, which I will do later on.

My question is "about" how much to trim for 156 mhz use. I will use an SWR meter to get it right on spot, but I would like a feel for how much to trim. It is tricky to calculate , even using the "468" formula, because of it being base-loaded.

Triming alone want do it, the base is designed to match the 5/8 2m to 50
ohms. Unless you can also figure out a way to modify the matching network
you cant do it.

You can start bu scaling the antenna length . That is devide 146 by 156
and get around .94. Then multiply the length of the element by .94.
As pointed out the loading (matching) coil will probalby need to be modified
somewhat for a perfect match, but this should get you close.

Start trimming by 1/4 " at a time.

Wavelength is 984 divided by the frequency. 468/f is the
length of a 1/2WL dipole and 234/f is the length of a
1/4WL monopole both taking end effects into account.

It's actually 983.572 and it's in English units
based on the "standard" length of the foot of
one of the British kings.

Yup, that is what is on the wall i.e. a foot, a yard e.t.c so that when there is a dispute in commerce one then goes to the wall and compare to the standard. As for the King it may have been Henry the Eight since he liked to hunt on the north (other)side of the river which was called The Isle Of Dogs but now it is probably named Canary wharf or something like that.Anne Boleyn lived a couple of miles away so maybe that is how she met the King. The observatory which is along side the meridian line at Greenwich was abandoned when London was electrified which thus disturbed the heavens.
It was also at the northside of the river of this point that most of the prisoners/convicts left for America to serve their sentences . After the revolution the prisoners/convicts had to go to Australia to serve their sentences. After a few years they had to scour the prisons for women to send to Australia so the men became settlers.So Cecil you could easily be an Aussie if your ancesters timed things right or you may not be even around if you were related to Cardinal Moore but don't lose your head over it like he did.

1500. Is the toroid on CRT monitor cables good for any ham-thing?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-18 04:04:56 UTC
From: mcalhoun@ksu.edu
Message-ID: <er8j98$pt5@unix1.cc.ksu.edu>
Source record: 45814

I recently "liberated" a toroid that is on every CRT monitor cable from
its molded-on plastic covering: it is a little over 1-inch long by
about 0.7-inch outside diameter, and its internal diameter is a fraction
too small for RG/8, but RG/58 and RG/59 fit without any difficulty.
Might its characteristics be any good for any ham use?

Hi OM,

Put a loop of wire through it and attach the wire to an antenna
analyzer, if you have one, and measure its resistance at any
particular frequency.

Anyway, I was kind of thinking keeping it as a 5/8th's, I guess I am guilty of having a one track mind. I agree with Tom that the hamstick will probably resonate but cut somewhat shorter than a 5/8ths to make up for the extra wire the 2 meter matching coil has. You will probably wind up with a 9/16ths antenna |:). If memory serves the hamstick does not use a tapped coil matching network, just a series coil. I have tried cutting one of tapped coil types for 153Mhz and was barely able to get it to work at with an acceptable SWR, good luck

Hamsticks usually have an adjustable stinger. Can
the stinger be adjusted from longest to shortest
and those two resonant frequencies be measured?
Is this the 9007 "Mobile Colinear Antenna" from
Lakeview? They don't say it is 5/8WL.

Hello,

Does anybody have a phisical dimensions of OA144 antenna (2m version).
There is a manual on the Parelectronics web page but without dimensions.
Another important thing is matching system in the closed box together with
current balun?
The idea is to duplicate antenna but with more robust design to meet
requirements for beacon 144 mhz antenna.
All informations are welcome.

Thanks
Adam, 9a4qv

After reading all of this thread I came up with a thought.
use it as it is and see if it works satisfactorily.
if not make a coax stub and connect with a "T" adapter and trim that for
optimal performance.

Those tend to be good up through at least VHF for keeping down RF
noise. I have used them on USB cables, and also on some APRS units,
with good effect. They are made so that trying them on an application
is easy, and unlikely to do any harm.

Hello Art,

As far as I know, all (maybe most) simulators for antennas assume the
media to be HILS, you can only enter properties like u', u'' or e'
e'', or in the form of absolute u or e together with a loss factor.

Probably there will be specialized simulators or custom programs
within research facilities that can handle non-HILS meda, but I think
that is of no use for antenna design for radiocommunication where the
interface is air.

Of course for propagation faraday rotation can be of importance.

If a metallic structure gives rise to polarization change, this will be shown by antenna simulators that can visualize field properties like E and H.

Best Regards,

Wim

Sorry, that one is not shown in the Worldradio
advertisement so I didn't know what it looked like.

> What is a stinger ? Are you referring to the stainless steel whip ?

Yes, the Lakeview web page says the 5/8WL is "Tunable
for other frequencies". My suggestion is to tune it
to the lowest frequency and measure that frequency.
Then tune it to the highest frequency and measure
that frequency. That should give enough information
to raise its resonant frequency by 7%.

If your system board is only 1-3 years old, the audio interface that is
built on it, makes a good starting point.

Art: I have been working on my closed_mindedness, and feel that I will
make
significant improvement if you will provide me with enough hard data to
build a version of your magnificent antenna.
1. Has a physical version of your antenna been constructed?
2. I have sworn off of EZNEC, so I would need a copy of your antenna
model, in any commercially available computor (sic) program format..
3. I have access to aluminum in plate, tube, or foil form. Would I need
anything else?
4. What would be the best way to feed the array, so as to prevent
intermodial
dirfraction?
5. I can mount the main elements on some Milford trunnions that I have saved
for just such a project. Do you think that bipolar status is attainable?

Glad to see you doing so well.

hi

a friend of mine might get permission to put up an antenna or two on top of his apt building about 30 stories up mostly flat roof

the other buildings for a good distance are less than 6 stories

so i was wondering how do you protect something like that from lightning

even if he disconnects the rig from the antenna you've still got well over 100ft of coax with a lot of charge

there are no other antennas up there just a red flashing light ontop of the elevator room

what is typically done?

running a heavy cable to ground downside the buidling is out

i guess it wouldn't be 'code' to grab a electrical ground out of the elevator room, and i guess equally bad to tie into the steal girders in there

so how do the pro's do it??

Likely the building already has air terminals (lightning rods) around its periphery. These probably are connected with heavy cable to the the steel skeleton of the building. If not, that is another story.

Your friend needs to directly ground his antennas to the same system as the air terminals for lightning protection.

Best regards, Richard Harrison, KB5WZI

From: Jerry Martes <j.jmartes@verizon.net>
Message-ID: <7S5Ch.268$4J4.220@trnddc01>
Source record: 45736

I have begun a project to try to record antenna radiation patterns of my antenna, using NOAA polar orbiting satellites as the illuminator. I am just starting to get data that shows the idea is feasible. The antenna constructed for 137 MHz, which is the satellite frequency. The received signal strength is recorded from the DC in the IF part of the receiver, so that is an S-Meter reading.
So far, I am able to get Excel to grind out "patterns" as a function of Time. When I get more precise, I'll relate Angle to Time so more meaningful plots can be drawn.

It is likely that this method of recording real radiation patterns has been done by someone, somewhere. I am now trying to understand how I can correct the data to account for the path loss, which can be as high as 12 dB.

My question is, does anyone know of anyone who has already done the math for supporting data acquisition like this "satellite illuminated pattern range". I'm running short on brain power.

Jerry

1523. Re: Resonating and Matching To A 476 MHz Yagi Antenna

Hi Ian

A folded dipole in free space is as you say close to 300 ohms. A folded dipole in a parasitic (eg yagi) array is reduced in Z in the same way that a "normal" dipole does in the same place. ie a 75 ohm FS dipole might get to 8 ohms with close spaced parasitic elements around it. In the same place a folded dipole would be reduced by the same factor. This means the feed Z is now around 36 ohms. You can also play with the respective diameters of the elements that go to make up the folded dipole to get a different Z transformation. I once built a 78Mhz device out of 3/4" vs 1/2" Cu pipe to get a feed Z of around 200 ohms - for a 4:1 balun to match...

You may also like to look at a complex impedance meter that uses tuned coax lengths. Gordon VK2ZAB (Now VK3 something) posted an updated design to Carl SM6MOM's original article - http://www.grantronics.com.au/docs Kind of hard to work out what's what. Just grab all the PDF's! It will tell you the whole feedpoint equation rather than having to fiddle with loose coupling a GDO.

Cheers Bob VK2YQA.

Hi Myles,

Your friend may stand getting static from the FAA if those red lights
are aeronautical warning lights. If so (and this is just a guess),
then he may be required to light up his mast (as well as paint it).

Checking with authorities might be warranted.

Mike I have now cleared the snow away so I have no excuse to day dream
while I get my strength back so I must now finish with this thread.
I pointed out earlier the relationships between curl and Faradays
rotation
where Faraday used a light and a electrical magnet to measure
polarization angle and where I connect it to curl is similar but time
variable related.
The corriolis forces are also connected but more specifically to the
earths magnetic field and where water revolves in different directions
depending on the hemisphere that you are in. With the television
addition I was looking at the magnetic yoke with the above in mind
which would suggest that what is in equilibrium in the northern
hemisphere would not be in equilibrium in the Southern hemisphere.
Since I know nothing about TVs that is all speculation on my part. Bye
Bye

Slab plots may not be the best term and it may be stack plots. Lets say
you have a plot of wave at time=o and another time=1 and so on. If you
stack these plots offset a bit using a transparent medium you can see
the wave as it decays over time. There's a good picture of this in the
Hewlett Packard catalog in the description of the HP 3561A. The folders
of Microsofts new Vista screen are a step in that direction.

In the southern hemisphere, the TV deflection yokes are wound in the opposite direction. This of course results in a reversal of the normal flow of current through the gun assembly. While in the northern hemisphere, the CRT contains three "electron guns" which shoot electrons toward the phosphor screen, in Australia they use a TRC which has three "hole targets" instead. The screen emits holes which are deflected by the anti-yoke, or ekoy, and routed to the appropriate color hole target. The hole targets are, of course, magenta, cyan, and yellow rather than red, green, and blue as they are in the northern hemisphere, and their filaments must be cooled rather than heated.

The scan lines in the southern hemisphere also proceed from right to left, bottom to top, but that's another topic. . .

An' that's nothin' but the dinkum truth, mate!

Sorry, I've been otherwise occupied lately.

Also, I don't generally comment in threads asking for software recommendations except occasionally to answer a factual question or correct the rare factually false statement, because the poster wants and should get unbiased opinions from users rather than the invariably biased opinions from developers and sellers.

As you can see from the responses, there are many choices, each with advantages and disadvantages, and the same choice isn't best for everyone. The only comment I'll make about EZNEC here is that anyone who does purchase it and isn't completely satisfied will get a prompt and full refund.

I do, however, believe very strongly in the power of computer modeling in general, and will readily recommend that anyone interested in learning more about antennas get some sort of modeling program.

That's an easy one.

The axial ratio of a purely RHCP wave is 1. The axial ratio of a purely LHCP wave is 1. The transformation would be 1 = 1.

Here's why some of the TV antenna elements are V shaped, and you can verify this with your EZNEC in a couple of minutes:

Take a 40 meter dipole and excite it on 15 meters. You'll find you get a cloverleaf pattern. Now bend each of the arms 30 degrees to form a vee with 120 degree included angle. You'll see that the lobes in the cloverleaf now line up to make a bidirectional pattern. The pattern on 40 meters isn't changed much by this modification. So you can make an effective 40/15 meter bidirectional antenna using this technique. (I've done it. Works great -- as long as the stations you want to talk to are in line with the lobes.)

The upper TV channels are approximately three times the frequency of the lower ones, just like 40 and 15 meters. So the same trick is used for TV antennas, making some elements do double duty.

This is, by the way, the principle behind the vee beam. As you make the dipole longer and longer, the lobes point more and more away from the center and toward the end. So you have to bend the antenna at more and more of an angle to get them to line up. This is where the graph showing optimum angle vs vee beam leg length comes from.

Can't help you with the slab plots or waterfalls,
but my Daqarta shareware has color spectrograms,
as well as spectra and waveform displays, signal
averaging, signal generation, etc.

FFT size is 1024 points, so you won't be able to use
this for tuning your guitar, if that's what you had in mind.
I'm in the process of adding a high-resolution
FFT peak position interpolator that might or might not
help that... it won't separate close peaks, though.

I'd be glad to answer any questions.

Best regards,

Bob Masta

Loop antennas of the sort used for 2MHz and below are of a different nature than a loop that would be used for 433MHz, generally. That is, low frequency receiving loops are generally a small fraction of a wavelength across (like commonly less than 1/100th), but at 433MHz, a loop that would be worthwhile is generally going to be a large fraction of the 27-inch wavelength of that frequency. The behaviour of the loop will be different than the AM broadcast ones. I suspect you will do better with a different external antenna. What sort of receiver will you use it with? Does that receiver have a connector for an external antenna? Could you put the antenna higher up in the air, and run an antenna lead to the receiver? Exactly what are you trying to accomplish? If the only thing you are trying to do is make an accessory that looks cool, the dimensions don't matter, but if your goal is to receive some specific signals you're now having trouble with, let us know a bit more about that problem and we can perhaps offer some suggestions.

Cheers,
Tom

The steel structure of the sky scraper is one of the best grounds you could have. It is effectively a Faraday shield around everything.

You ought to find out where the ground connections for the existing lighting rods are and use that. If there are no lightning rods around (shudder) find some structural steel close to your antenna, and bug (clamp) on to it. I would also suggest following an electrical panel ground around to see where its ground is. They too ought to be on building steel.

Good Luck!

Even if it does, this antenna is likely to protrude above its zone.

Hi Bob,

Why not? 1024 points (bins) has enough resolution to shake out every
note on a Hawaiian slide guitar. The only care is selecting the
sampling rate and most FFT packages should be able to resolve
exceedingly fine.

http://en.wikipedia.org/wiki/Coriolis_effect

Um... The effect you are talking about doesn't have anything to do with the relationship between magnetic fields and electric fields. It has to do with the difference in surface speeds between the poles and the equator and how that difference interacts with various fluids. In the Northern Hemisphere as these fluids move southward, they will be seen to swing to the west because the earth is spinning towards the east under them.

So... If one had a US TV in Australia, then it would work exactly like it did in the US. (Voltage, frequency and video format aside.)

In the NORTHERN HEMISPHERE...
The LAND moves COUNTERCLOCKWISE around the North Pole.
Air flows COUNTERCLOCKWISE around a LOW pressure zone.
Air flows CLOCKWISE around a HIGH pressure zone.

In the SOUTHERN HEMISPHERE...
The LAND moves CLOCKWISE around the South Pole.
Air flows CLOCKWISE around a LOW pressure zone.
Air flows COUNTERCLOCKWISE around a HIGH pressure zone.

... similar effects are also noted in magnetic phenomenon and
objects/properties affected by magnetic properties.

I know of no complete studies which have reached any conclusive ends in
the directions you seem to suggest. Most likely, not enough is known yet.

Yes, but they don't change direction.. The relationship between a traveling electric field and associated magnetic field are still related by a vector cross product that does not change no matter where you are on the earth's surface or in space, (Einstein and Hawking's black hole theories aside.) This means that a beam of electrons will be deflected exactly the same way by the same magnetic field no matter where you are and your TV will work the same way at the north pole, Amundsen-Scott Station and everywhere in between.

Hi Hank,

Yes, I have. It is exceedingly expensive, but you can probably get 30
days of free use if you have a one-time knock off project. Of course,
it may take 30 days to figure it out.

FFT analyzers are a dime a dozen, but few know how to use them
accurately - or are even aware of what can be done with them. Bob's
complaint, notwithstanding, a 1024 bin FFT employing the proper mixing
inputs can resolve any note on a guitar to within hundredths of a
cycle. I am sure this is of no interest to you, however.

What are you trying to measure? The dime a dozen analyzers (meaning
free, or packaged with other software) can do enough if you are not
particularly demanding.

Over the years, the most useful FFT software I've had, is the (fairly
simple) FFT analyzer in Audition/CEP. It's big plus is the ability to use
the Audition/CEP audio editor to select portions of real-world waveforms,
and to use the wave generation and modification features to create waves for
use in analysis and testing.

Oxygen molecules are ever slightly magnetic ... one-third of waters composition is oxygen molecules.

When you pull the plug in your sink, in the northern hemisphere the "whirlpool" which forms spins in one direction, in the southern hemisphere the opposite direction (this computed on an average, or, force/contrivance can be applied to change the direction of normal spin.)

I know of NO ONE who claims to know FOR CERTAIN, EXACTLY why, this happens or is able to offer conclusive proof ... to say more would only be guessing. To say the previous in any other manner would suggest more is known than actually is ... that is simply all which IS "known."

One can extrapolate upon the above and venture guesses/theories, caution should be used when doing so.

you don't. you add proper arresters and connect to the existing building ground to handle the inevitable direct strokes. and don't do it on the cheap or he may be liable for damage to lots of other stuff when the lightning follows his transmission line into the otherwise safe building.

Hi Arny,

I am sure this is an useful tool, but without windowing the data, any
semblance to reasonable analysis is a house built on sand. I note in
your provided link to work you have done that you use Blackman
exclusively. This is at least a good first pass to achieving an
analysis, but any variety of work is going to be more demanding (the
Blackman window has its limitations), otherwise it is like looking
through glasses smeared with Vaseline.

radiation doesn't curl, fields do, and coreolis force is ficticious, you can counteract it by placing your canoe paddles at right angles to the direction of motion as you circle a whirlpool in your boat. as for tv's, everyone knows that you have to reverse the magnitization on tv's when you cross the equator, if you don't all the colors come out wrong and the pictures are all upside down.

The delay lines I encountered at IBM that were used for storage were
"sonic" delay lines. They were driven in a torsion mode (mechanical)
and were very reliable up to about 10 milliseconds(I think!) of data.
Above that they began to be temperamental and required constant
temperature ovens. The larger ones were used as video storage with a
screen of data in each instance.

Delay lines running at light speed (about a NS per ft) were used as
clock generators by inputting a pulse and tapping the line down stream
for a very stable clock sequence.

Amy, Bob, Richard
Thanks for your response and interest. I'm retired used to be an
engineer
before management laid waste to that. I've started taking weekly guitar
lessons over a year ago and slowly getting a bit better. It's a hell
of a challenge at 66. I want
to buy a better guitar and all guitars don't sound the same, even the
same model. One shouldn't expect them to because they're all made from
different cuts of wood and assembled by human hands. What amazed me is
that the materials used for the nut, neck, saddle and bridge as well as
the mfg and age of the strings have a noticeable effect on the sound.
The bridge pins, angle of the strings out of the bridge pin holes and
tuners also have effects.
In the last year I found at least four guitars that I really liked, 3
used ones and a new one all over a $1000.00 but I passed because I'm not
that impulsive or flush with cash. A good player can make just about
any guitar sound good, or a hell of a lot better than me.
I'm into ham radio also and last year at hamfest I traded for an HP
3582A spectrum analyzer but the learning curve is a bit steep for me.
So unless I can find an experienced user or devote much more time to it
I'm going to have to trade it.
Last week I won an HP 3561A on ePay but it has a problem that I hope I
can fix. In the meantime I thought it might make sense to scope out
sound cards and related software. I know a lot of hams use sound cards
for various & different applications and it's about time I took a wack
at one and what better way than trying to figure out what it is that
makes one guitar sound so much better than another. Or if changing the
nut, saddle or bridge pins really improves the sound or is it just
wishful thinking.
And I can make use of it for ham radio weak signal detection and
analysis.
I used a term; slab diagrams which may be known as stack diagrams. I'm
interested in watching a plucked and later chords as they decay over
time in sort of a 3D plot. There's a good example of what I'm looking
for in the HP catalog describing the HP 3561A.
tnx

1564. Re: delay line? velocity factor???

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-20 01:42:58 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <12tkkh6n7us4v19@corp.supernews.com>
Source record: 45628

A feature of the '50s-era radars I worked on in the '60s was MTI, or moving target indication. It was done simply by subtracting the return from the previous pulse from the current one and displaying only things which had changed. This was done to reduce clutter from fixed objects, and it was effective against some jamming techniques. Doing something like that is trivial today, but it wasn't back then. The pulse repetition time of the long-range radars was over 2 ms (round trip time for 400 miles or so), so a delay of that time with a bandwidth of a few MHz was required.

The sets I worked on used a large piezoelectric quartz slab with many faces, and transducers on two of the faces. One transducer would convert the electrical signal to a mechanical wave which would enter the slab, bounce around from one face to another, until at the right time it would hit a face below the critical angle and exit. And that face was, of course, where the other transducer was. To keep the timing precise, the slab was used to control the radar pulse interval.

Not long before I was involved, a mercury delay line was used. This was a tube of mercury with a transducer at each end, and a mechanical wave was sent from one end to the other. I never saw one, but heard many stories about how fussy they were and that it would take hours or days for waves to settle if it was bumped or jiggled. Folks who had dealt with them considered the quartz delay line to be a big improvement.

For real, normal, manufactured sinks, toilets, and bathtubs, this is not true.

In a perfectly smooth, level, and symetrical sink filled with absolutely
still water, it will always go the same way and this is trivially explained
by the corriolis effect.

For real world sinks, the deviations from perfect smoothness, levelness, and
symmetry overpowers the corriolis effect and the water goes which ever
way dominates from the imperfections.

> One can extrapolate upon the above and venture guesses/theories, caution

Or one could get an education in basic physics.

The physical world is within the realm of understanding for at least
50% of the population.

I guess you are in the bottom half.

This has been understood by the educated world since about 1778 when
Laplace published his tidal equations, or 1835 when Gaspard-Gustave Coriolis
published.

Your education seems to be a bit behind the times.

It is quite obvious the "Coriolis Effect" has NOTHING to do with water
taking its' whirlpool course down the drain in regards to its' current
hemisphere ... but you grow predictable. I figured you would lack the
intelligence to see this obvious fact.

You probably would amuse a high school physics lab to no end, ever try
dressing up in a clowns suit and visiting one?

My recollection was that LC delay lines were also used, and MTI radar was very useful for close in to the airport where structures (the built environment) created the greatest clutter problem distinguishing low flying aircraft, so shorter delay times (hundreds of us) were adequate.

Other techniques I have come across for various delay applications, including circulating memories included various forms of semi-distributed LC elements, coils of piano wire with magnetostrictive transducers, and early dynamic shift registers that were a kind of charge shuffling arrangement.

Obviously you have a sink, you can prove it correct.

And, indeed, it is correct. Has to do with the oxygen molecules slight magnetic force in interaction with the appropriate pole of the earth.

My goodness. Who would have guessed so many could benefit from a simple high school physics course, and then an introduction to antennas?

What a neat project!

I can tell you, based on years of experience with changing out the parts
that you mentioned (nut, saddle, bridge, pins, ESPECIALLY break angle)
that these things DO make a difference in the sound. I have NOT heard a
difference with changes of neck or tuners (certainly these things affect
the intonation of the instrument, but I've never known then to change
the quality of sound).

However, the choice of wood, body shape, and top bracing are far more
relevant. You might want to check with Martin, Taylor, Larrivee, et al

to see if they have any scientific info that can help you. They aren't in the business of pushing pins, tuners, etc.

Good luck and please post what you find out!

(Since this is RAO, I should point out that my hearing of the things mentioned in my second paragraph above is based on differences heard based on changes made to the instruments when it wasn't possible to know about the changes.)

Jenn
The neck wood affects the sound energy as it goes from the nut vibrate
the guitar and so does the truss rod. Tuners can influence the sound
because their weight can dampen vibrations. An interesting thing is to
hold a tuner lightly (or the headstock) when
you pluck a string and feel the vibrations.
A good analysis should be able to detect loose bracing and you should
also be able to see the effects of scalloped bracing.
I shotgunned this query because I didn't know where I would find the
most help. If responders can suggest a group I could limit it and not
waste time of those who aren't interested.
I've also made unconnected posts to other groups, but have less interest
and reponse so far.
I didn't post to any guitar groups because most there are musicians that
don't need this kind of crutch and have an ear that's been trained for
many years. I want to see if I can catch up by being able to see.
In addition it should be helpful in voice training which I also need
because I'm trying but with less success to sing.

The problem is that the line resolution of an FFT is the sample
rate divided by the number of time points. So with 44100 Hz
sample rate and 1024 points you get a bit over 43 Hz per line.
So the first non-DC spectral line would be 43 Hz, which is about
a low F on a bass guitar, and the very next line would be the F
an octave above that... you'd miss an entire octave!

The standard musical note frequencies (semitones) differ
from each other by about 6% (12th root of 2, since there are
12 notes in an "octave"). But you need much better
resolution than this for tuning, typically a "cent" or so,
namely 1/100 of a semitone or .06%. At 43 Hz that
works out to about 0.026 Hz. A 64K-point FFT
at 44100 Hz will have a native resolution of 0.67 Hz,
which still isn't good enough... but at 64K samples,
you are looking at 1.48 seconds of sound. If the
pitch changes over that interval, the spectral peak
will be smeared even further.

If you attempt to beat this game by going to lower
sample rates, note that frequency resolution is
still proportional to the inverse of the total sampling
interval. So if you tried to use the 1K FFT but sample at
44100 / 64 = 689 Hz to get the same (inadequate)
resolution as the above 64K FFT, you'd still need 1.48
seconds of sound. Sound cards don't sample that
low intrinsically (typically 8K lower limit, 4K on old

Sound Blasters), but you might manage using sample
rate conversion (either Windows or sound card built-in).
I haven't tried this, but I suspect that it would not be a satisfying
experience due to the s-l-o-w time response.

Best regards,

Bob Masta

Yes, you can easily resolve to 100ths of a cycle, but not from
a native FFT. (See my other response.) You can do it from
the waveform by measuring the time between cycles. That's
one of the methods I'm working on. The other is to do it from
the FFT via peak interpolation. The waveform method will
be very accurate with simple static waveforms, but I expect it
will have trouble with the 2nd harmonic of a plucked string,
which is not an integer multiple so "rolls" through the waveform.
The FFT interpolator will not have the same raw accuracy, and must
have absolutely separated spectral peaks since it assumes the
one it's interpolating is the only one. I'm not hopeful it can be
made good enough to tune a guitar, at least not in the bottom
octave where the harmonics land on adjacent spectral lines.

In order to observe the Coriolis effect in draining water, several
extraordinary precautions must be taken. You must have a smooth circular
pan with a precisely centered and very small hole in the center. The pan
is filled with water, and allowed to sit for enough time that all motion
of the water is gone at the onset of the experiment. My source suggests
a week. Then the stopper must be removed from below in a manner that
doesn't disturb the water. (save the obvious) If the flow is small

enough, and no other disturbances occur, after about an hour, a cyclonic rotation occurs.

For all practical purposes, the effect is only applicable for large and long lasting fluid motion.

Too bad that, it would be fun to watch water refuse to swirl at all if we emptied a sink at the equator. 8^)

Jenn apparently thinks that the changes in SQ that come from modifying the working parts of musical instruments are fully comparable to say, adding one more strand of wire to a speaker cable composed of finely stranded wilre.

In a recent email to an acquaintance of mine who lives in Australia I asked him what the action of draining water was down under. His reply was that results were mixed with some drains turning counter clockwise and some drains turning clockwise. Sometimes it was the same drain.

It seems the jury is still out on the subject.

Gentlemen, gentlemen calm down
Let us l;ook at how this myth came about

A gentleman obtained a glass container and filled it with water.
To make sure every thing was kosha he placed a school clock over the
container of water and then called his friend down under to
corroborate the experiment. Being a friedly man he descided to place
the clock under the container so the man down under could also see the
clock. He then pulled the plug and watched as the water circled
clockwise and then asked the man down under which way did the water go
and to his surprise the Aussi said counter clockwise!
Now stop this foolishnes and consider what Roy said about Aussi T.V.
He stated that the yoke on the CRT was wound in an opposite way to
T.V.s in the upper hemisphere so why not consider the implications of
that and let the past be seen as water under the bridge
Art

It is a matter of scale.

The coriolis effect is weak and directly a function of distance.

Water in a sink is a tiny distance and the effect is miniscule.

On huge things like weather fronts, the coriolis effect is quite obvious.

Firing tables for long range artillery have corrections for the effect.

True; I was thinking of the neck shape. The question is, of course, can
one hear the difference between different neck woods on the same
instrument body.

> Tuners can influence the sound
> because their weight can dampen vibrations.

But can one hear the difference between different tuners? I seriously
doubt it.

> An interesting thing is to
> hold a tuner lightly (or the headstock) when
> you pluck a string and feel the vibrations.

But can you hear the tone quality change as you hold the tuners? I
can't detect that difference on any of my instruments.

> A good analysis should be able to detect loose bracing and you should
> also be able to see the effects of scalloped bracing.

Indeed.

If you go to rec.music.makers.guitar.acoustic, you'll find several
outstanding luthiers there who may be able to offer help. And though I
don't hang out there, rec.music.makers.builders might also include
similar folks.

Good luck, Hank!

To bring antennas into the discussion:
Many years ago when a grad student working in the vicinity of, and eating at the same table with, Grote Reber, he noted that the bean plant wound itself in the opposite direction in Tasmania than in the US. (We never left the meat plate in his vicinity.) While constructing new instrumentation to measure low frequency radiation from space (housed in beautiful cabinets that he made) using an antenna with directivity determined by the relative thinness of the ionosphere in Tasmania, he tended bean plants that he caused to grow the wrong way.
He published papers on the subject in 1960 and 1964. As I recall, one finding was that yields increased if beans were caused to do what they do not want to do.

So, at least two things arise from this: plants can do different things in the two hemispheres and the ionosphere is "different" in the two hemispheres.

The like of Grote the world is not likely to see again. His ability to see significance in well known things was awesome. It only he had had a publicist, he would have received a Nobel prize.

Crap, another post from the same morning before breakfast! <blush>

What I meant is that the differences that I heard after changes in the
instruments were heard without me knowing that changes had been made.
Thus, there was no "listener bias", a favorite topic around here at
various times.

Whatever Arny is blathering about, I have no idea.

>I have no idea what effect they have on actual results????

The designer of Spectra is a local Ham - I know his capabilities, I
don't know yours. All I have to go on is the pedestrian choice of
Blackman windowing that demonstrates nothing in the way of "ideas on
the effect on actual results." As I offered, it is an ordinarily
suitable choice if you have no demanding requirements.

Hi Hank,

There are a world of free analyzers, one quick search found 16:
http://freshmeat.net/search/?q=fft&section=projects&Go.x=11&Go.y=10

Get your feet wet before throwing the green at bloatware designs that
invest their resources in advertising. If you find nothing in this
first list, I can certainly 26 find more.

I got it now, I'm dealing with a FFT snob, not someone who just sees them as
a tool to get a job done.

OK, since I'm dealing with a member of a lesser species, I'll spell it out:

As a rule, changes in the mechanics of musical instruments have relatively gross effects, compared to the sort of things that many high end audiophiles fret about.

> Whatever Arny is blathering about, I have no idea.

Yup, much of what I write is over the heads of members lesser species.

That's great news. Now does anyone know whether it will run under CrossOver (the CodeWeavers implementation of WINE for Intel Macs)? That would give me an excuse for upgrading from a year 2001 G4 PowerPC Macintosh to a year 2007 Intel Macintosh. Mac OS X is to a large extent based on the BSD variety of UNIX.

I know that the CodeWeavers people have mainly concentrated on getting things like the Windows versions of the Micro$loth Office suite of programs to run under CrossOver, the point of which escapes me since Office has been around for Macs even longer than it has for Windows machines and thus Mac users are under no pressure to be able to use the Windows versions of the Office programs. (Word and Excel files are, for the most part, platform-independent, or at least are easily translatable between Windows and Mac formats. I frequently turn Mac Word 5.1a files into Windows XP Word files to give to my daughter, and do the reverse when she sends me Word files. Such translation is easily done on a Mac, and with some difficulty can be done on a Windows machine.)

Ironically if I were to get an Intel Mac, one of the programs I could no longer use is the lean, mean 1992 Mac version of MS Word 5.1a, still working nicely after 15 years on my year 2001 computer. This program runs faster and better under Classic (i.e. Mac OS 9) within Mac OS X than it ever did in the old days. Two layers of emulation are going on here -- OS X is emulating OS 9, and the PowerPC version of OS 9 is emulating a 680x0 CPU on a PPC chip (G5, G4, G3, or earlier) -- Word 5 was written before the days of the PPC chips. Classic is not readily available for Intel Macs (there are semi-satisfactory hacks which make it sort of work).

1602. Ferrite rod antenna for ne602 mixer

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-21 06:20:49 UTC
From: Bill Bowden <wrongaddress@att.net>
Message-ID: <1172038849.920492.41030@m58g2000cwm.googlegroups.com>
Source record: 45666

I'm trying to match a 4 inch ferrite rod antenna stick to the 3K balanced input of a NE602 mixer chip on the AM broadcast band (540-1650 kHz).

The primary has about 100 turns and I've tried 25 turns on the secondary to feed the 602 with reasonable results, but I don't know what the optimum would be.
I added another winding of 50 turns tapped every 5 turns and experimented with that, but it seems to work best with the maximum turns. But there isn't much difference from 25 turns to 50 turns on the secondary. Seems the more the better, but there should be some optimum.

Anybody know where the best place is to locate the secondary winding, and how to determine the optimum number of turns to yield a 3K output impedance?

Thanks,

-Bill

Not anything regarding use on Linux. The version that's capable of running on a Linux emulator has been available only about one day, and as far as I know only one person has tested it on that system.

The demo program is free, at http://eznec.com. While there's a small possibility that the full program would fail on a system that can run the demo, it's not likely. So anybody wanting to know about a particular system should just download the demo and try it.

I know that all EZNEC program types have been run successfully on Macs for many years using the SoftWindows emulator.

Ironically, the change to EZNEC which made it able to run on Linux was made in order to make it work under Microsoft Vista.

Maybe the lack of responses is because of the obscurity of the "s-plane summation". I've never heard of it, and a web search brought only one or two possible hits from publications I'd have to buy in order to view. Any principle with that low a profile on the web is pretty esoteric.

Thank you for replying.

This project was originally intended to help my dad who had mobility
problems, and though it is no longer needed for that purpose, I wanted
to carry it through to completion out of curiosity.

The application is for use with one of those remote-reading barbecue
thermometers which is at the end of its 100 foot range and where the
receiver is located inside a condominium which has metal-framed windows
and metal doors. The receiver will work 10 feet closer to the cooking
area (and ten feet further from the structure) but since it is then
outside, it loses its remote-reading usefulness.

I was hoping to find an unamplified way to make the signal slightly
stronger just inside a window. The only method I have of determining
sufficient signal strength is to push the "synchronize" button on the
transmitter and see if the receiver display changes from "-----" to an
actual temperature reading. I had hoped that a small loop in the center
of a window pane would allow me to set the receiver on a box inside the

window.

These units have no external antenna conections, but looks is of no importance as far as coil design goes. If someone can suggest a way to use a "pickup" coil closer to the cooking area cabled to a "relay" coil on the outside of a window, that would even be acceptable.

If someone can suggest a weak local oscillator circuit (preferrably crystal controlled) that I can use to beat against the 433MHz transmitter frequency in a standard broadcast receiver front end so that signal strength measurement could be taken, I would also be interested in that.

Thanks in advance for any suggestions.

Roy, to kick it along a little...

The technique calls for making sets of measurements with the antenna in three orthogonal orientations and summing the z, y and z plane values to an "s plane" value to represent maximum field strength. I think the summation that is typically used is the square root of the sum of the squares.

The technique suits automated measurement where a series of perhaps hundreds of measurements at different frequencies are made, the antenna is manually changed, and the series repeated etc. Software is then used to process the logged measurements.

Clearly there is an issue about the temporaral nature of separate measurements in each plane at a given frequency.

I was interested in any standards or regulatory "procedures" that may exist that describe / mandate such technique. Most procedures that I have found just call for orienting the antenna for maximum response rather than the x,z,z trick.

I would like to understand its application better to for a view about the appropriateness to particular applications. I suspect its main value is in automated EMC data capture.

I am still on the BPL measurement tram!

>
>I got it now, I'm dealing with a FFT snob, not someone who just sees them as
>a tool to get a job done.

Connoisseur is more appropriate, and as for getting the job done, I
did that on contract to HP for one of their many FFT audio analyzers
22 years ago. I've written 200,000 lines of fourier code for many
products that get jobs done.

I also have the seminal work by Blackman and Tukey that predates the
math of the Fourier transform: "The Measurement of Power Spectra."
An extract bears repeating:
"'... we were able to discover in the general wave
record a very weak low-frequency peak which would
surely have escaped our attention without spectral
analysis. This peak, it turns out, is almost certainly
due to a swell from the Indian Ocean, 10,000 miles
distant. Physical dimensions are: 1mm high and
a kilometer long.'"

The Hann or Hamm windowing functions are preferable as even Blackman
would admit and even these two are hardly exemplars of outstanding
performance. My designs exhibited a noise floor of -200dB
(statistical noise from the transcendentals' math). A poor Blackman
window would throw away 120dB of that to offer only -80dB. -80dB is
certainly impressive to mundane applications, but most would agree
that very little more effort was needed to gain 12 more orders of
magnitude in performance.

Hi Hank,

If you've waded through my prior list of freely available Fourier
analyzers, more can be found at:
http://sourceforge.net/search/?type_of_search=soft&words=fft
Not all are applications however.

However, you should probably try to get a copy of HP's Application Note 243-1 "Dynamic Signal Analyzer Applications." Of particular note for your studies into the nuances of investigating construction materials in Guitars (I did it with Violins), you should study the Fourier math relating to "Coherence" suited for a dual channel analyzer.

Hello, Roy, and all. I have used a g77-compiled version of NEC-4 on a
Linux platform and it worked fine. The GNU compiler works with FORTRAN-77
source code as well as C. I assume a g77 compilation of the NEC-2 source
code would also work. Of course this is just number-crunching NEC that
does not provide the other bells and whistles of EZNEC. Sincerely, and

Ya know, older Pentiums can be had for a song at flea markets,
Salvation army, church donation sites, etc.. And are free from trash
bins, and curbsides - especially near the local college at the end of
every semester...

An older pentium may take a few more seconds to crunch your Eznec
design compared to some 3GHZ screamer, but that gives you time to
think (and scratch) whilst waiting...

So as opposed to spending thousands on a new Mac, how about getting an
Eznec box for cheap...

Hello:

I do a lot of listening with a Uniden scanner on pretty much all of the scanner freq's, from perhaps
25 MHz up to 956 MHz, or so. These are of course FM and AM.

Have two antennas: One a R/S Discone, and the other a Scantenna.
The Discone is presently hooked up to a sw set that also has capabilities in the scanner freq. range.

Was wondering, about this, as I saw a very brief mention in a maghazine about using "Combiners"
to combine the outputs (capabilities) of two antennas into a single radio's input.

Is this possible, and is there anything to be gained ?
What about phase differences, etc. ?

Can't imagine that it works to improve things, but really don't know.
The article was, unfortunately, more of a mention that it is done, rather than any technical details.

So, what would happen if I "combined" my Scantenna and R/S Discone into my scanner's input ?

Thanks,
Bob

Well, if the field is changing in an unknown way, measurements at x, y,
and z axes at different times would be meaningless of course.

Calculation of the resultant for a static field is not really a trick.
In the absence of a triaxial instrument, that may be the only practical
technique available.

> I would like to understand its application better to for a view about
> the appropriateness to particular applications. I suspect its main value
> is in automated EMC data capture.
>

You are talking about simply calculating the resultant of three orthogonal vectors. Not an esoteric technique. Its main value is in making a measurement without a triaxial instrument. Or, alternatively, positioning a single-axis instrument for maximum reading and then measuring the position coordinates of the instrument's axis.

Many triaxial instruments have three orthogonal probes and calculate and display the resultant automatically. Three orthogonal measurements separated in time and requiring separate calculation of the resultant is a move away from automation and accuracy, I would think.

You might search instead for discussions on measuring static magnetic fields with single-axis gaussmeters. Inexpensive gaussmeters are commonly used in this manner. I get ~350K results in a google search on "triaxial field measurement."

1617. Butternut HF-9V as elevated-feed groundplane

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-21 15:28:03 UTC
From: Eric <reply.in.group@nospam.no>
Message-ID: <pan.2007.02.21.15.28.01.976806@nospam.no>
Source record: 45681

Any of you have any experience with the Butternut HF-9V with TBR-160S 160-meter add-on, when mounted as a ground plane with the base elevated to, say, 20 or 30 feet?

I'm wondering how that will work with four ground plane radials as contrasted with ground-mounting and an extensive buried radial system.

I have the ideal place to mount one, about 25 feet in elevation at the base, and can string two radials for 160, three radials for 80, and four radials for 40, tilted down a little (but not the 35 degrees of downward tilt that I read somewhere is the ideal downward tilt for a ground plane to raise the feedpoint impedance to 50 ohms).

I'm hoping that those radials will also be enough for operation on 20 meters... it would be difficult (but not impossible) to also string four more radials for 20 meters.

Ground mounting this antenna with an extensive buried radial system would be very difficult (but not quite impossible if it would REALLY make the difference).

What are my chances for good success working DX with this setup and about 70 watts of power?

Would it be worth the extra effort to try to get the base of the antenna up to 40 feet rather than 25 feet?

Thanks...

>great Roy, but do us all a favor and port it out to linux so we dont have to
>play with wine to use it.

What I need is an operating system that will run all the software that
XP does without my spending much time tinkering with it.

I revisit Linux every few years with a fresh release and an identical
machine to my Windows system. SUSE 10 has come close but some of the
simplest things elude me. Since retirement 15 years ago I have become
isolated from other users except on the Internet. When I seek answers
to simple questions I an usually overwhelmed with a flood of answers
of varying usefulness.

I would like to run my windows and dos software on my Linux machine
with NTFS support, attached to my LAN. I want to be able to install &
delete hardware and software with processes that behave in a
consistent manner. I should be able to use my PIC programmers and my
ham radio software with out tinkering.

Until that happens with Linux I am locked into an XP machine and a
Win 98 machine in the configuration. I don't want to discourage the
Linux community but at this time it is best suited to the business
user where a few applications on a number of systems will get the job
done.

Owen,

Where, I guess, "S" is the Poynting vector? I have made attempts at
estimating
the TRP from a NEC output file -- including the ground wave. The results
appear to be reasonably correct, but have no means of verifying the results.
If I am on the right track I can send you my Excel spread sheet clearly
showing
the method I used. I did the analysis for Reg in order to compute the true
radiation resistance of a ground mounted monopole. I have a MathCAD 7
document, which also shows the method I used, and is probably easier to
interpret.

The problem for 160 is the antenna is still real low in height as far
as
wavelength. To have *good* performance with an elevated GP and 4
radials,
you really want the base at least 1/4 wave up. Less will work, but the
number
of radials required to maintain the same performance skyrockets...

It might work, but it would do quite a bit better with extra 20m
radials.
If the radials are not resonant for the band in use, they won't work
very
well, and decoupling will usually be poor. You can use 3/4 wave
radials,
so if any of those low band radials come out to 3/4 wave on a higher
band,
they will work ok. But 80 or 40 meter radials won't quite work out for
that.

Fairly lackluster unless the band is super quiet.
>
> Would it be worth the extra effort to try to get the base of the antenna
> up to 40 feet rather than 25 feet?

Yes and no... Will help 40 a lot. 80 some.. 160, not a whole heck of a
lot..
40 ft is still low in terms of wavelength on 160.
Say you had a ground mount with 60 radials.. To equal that ground loss
with
four radials will require the antenna to be at about 1/4 wave height.
At 1/8 wave up, you would probably need at least 30-40 to equal the
same performance. And 1/8 wave up on 160m is about 60-70 ft... :(
At 25 ft up, it might as well be on the ground as far as the number
of
radials needed for 160m. 20 meters would be just fine at that height
though using just 4 radials.

The only time I have ever heard reference to this it had to deal with measureing the field strength of the far field beam of a radar antenna. Its been a while but I am pretty sure it had something to do with checking out a polarizer for proper operation when it was switched from linear to circular..

I know of commercial AM broadcast stations using 6-8, ~1/4-wave radials elevated less than 20 feet over (rocky) ground, with an antenna system radiation efficiency meeting the FCC minimum for broadcast station use.

Also this quoted conclusion hasn't been supported by the NEC evaluations of L.B. Cebik as given in the paper linked below. Figure 16 in that paper shows that the gain of a vertical radiator is within tenths of a decibel of its peak maximum value with four radials each 1/4-wave long, when the whole system is elevated only 0.075 wavelengths above the earth (about 41 feet at 1.8 MHz).

Recompiling Fortran code which has no interaction with the user other
than getting text input from one file and writing text output to another
is a vastly different problem than re-writing a 60,000 line Visual Basic
interactive graphical user interface in another language then
recompiling for Linux while retaining full functionality of all
features. The difference between the two problems seems to escape a lot
of people, but problems do always look easier to solve when it's someone
else's job to solve them.

Art,

I looked at your webpage at

http://home.insightbb.com/~aunwin/index.htm

I don't understand how you claim that all three elements in your cluster are resonant given that the drive impedance of two of them is highly reactive.

Your antenna appears to be a fairly mediocre weird yagi.

You can continue to write science fiction about how radiation is caused by particles ejected from the conducting material and their curling action about the element, or whatever it is you're talking about. Have fun. Sorry if my pseudo-self is going to keep pseudo-thinking that your antenna is more or less a pseudo-two-element yagi.

How does that minimum compare to the usual 120 or so radials on the
ground?

> 1.8 MHz).

Well, a model can say one thing, and the real world performance
another.
I'm not saying it wouldn't radiate. It would. But it's not going to be
any world
beater for dx. For sure, it won't be living up to it's full
potential.
Four elevated resonant radials at 40 ft are better than 4 ground mount
radials, but
at that height you really need quite a few more if you want to equal a
stout
ground mount setup. If you have 60 radials on the ground, you need
about
20-30 at 1/8 wave up to equal the same appx ground loss. And 1/8 wave
on
160 is about 60 ft or more.
When I had a 40 meter ground plane at 1/4 wave up, "four sloping
radials"

I tried using it lowered to about 1/8 wave after working on it, and I had the mast
down. I tried it for a night. It didn't work near as well as when it was fully up to 1/4
wave when working most anyone. VK was probably almost 2 S units down from my
usual report, just using that crude estimate to compare. It was noticable for sure.
If you can get up to a 1/4 wave, and have at least 4 radials, then it is pretty good.
And even that is not quite optimum, 10 would be better. It's close enough though...
I've read of quite a few low band ops trying verticals, with low elevated radials, with
usually a low amount. Most of them end up scrapping it after a few nights of #$%&,
and laying out 30-60 ground radials. Most claim it woke the antenna up.
I'm a great fan of elevated verticals on the low bands. The one I had on 40 was very
stout. But I don't recommend them low to the ground with only a few radials, unless
you are ready to accept the quite noticable hit in performance.
That's what can give the verticals a bad name..
You would probably be better off setting up a good mobile antenna on a large truck and running
coax to it. :/ No joke.
But it wouldn't hurt anything to try out what he proposes.. If it doesn't pan out, he can
always go back and lay the wire down. It would be much better than not operating at all.
On 160, a lot will depend on the noise level.. Some nights a weaker signal will do ok,
other nights, it's teeth grinding torture... On the low bands, I don't like to throw away power to the
ground, that could otherwise be radiated if I can avoid it. Sometimes it's hard to avoid
with some locations, restrictions, etc..
It's not that I try to discourage running less than optimum verticals, I just hate to see
people try them, and then end up thinking most all verticals perform about the same. If they
scrimp in some way, either with height, or number, they will lose some performance.

It's not clear what the objective is. NEC and EZNEC have the ability to sum the power from the field at all calculated points. This is used in its "average gain" calculation which reports the ratio of total power in the field to power applied to the array. (NEC, but not EZNEC, also applies another factor of two when evaluating a system over a ground plane.) You can extract this total power value by multiplying the reported average gain by the power from the sources (and the additional factor of two if necessary).

I don't know if this is the end result you're after, but it sounds like something in the right direction. You could of course analyze an antenna with two orthogonal elevation plots and an azimuth plot to generate data for three orthogonal planes, then sum them manually or with a simple program. I have no idea what the meaning or use of the resulting number might be, though.

hate to show my ignorance, but are the ibeams really 'ground'?
usually i've seen them either sitting on concreate squares or on
larger concreate foundation wall like things so i always figured
they'd be rather isolated from ground beside what little connecitivity
was in the concreate itself which i know would carry a lightning
strike, if hit but not the other way around ie higher resistance
so i ponder

same for the electrical pannel ground to be attached to the building
steel ??

i dunno

Thanks Frank, it is more about summation of field strength measurements in the real world to a single figure representing max field strength (in whatever orientation) at that location and frequency.

I was hoping I might find procedures specified by regulatory authorities for measurement of such... but searching hasn't turned up much.

I understand that, but "representing" in what way -- an average, weighted average, RMS, probability density, something else? And what would it mean? Is it supposed to tell how much interference will be created for the overall community? Will an antenna with a narrow beam pointing straight up give the same number as one with a narrow beam pointing horizontally, or are the data for the axes weighted differently?

This is a means of data reduction, in which the result has less information than the original data. 3D field strength data *does* represent the emission field strength, but any summation and consequent reduction represents less information than this.

I'm not saying that industries or the regulatory agencies won't use something like this to "prove" whatever they need to prove -- but it should undergo some critical scrutiny to see just what its meaning really is.

After all, half the children in the schools are below average!

I'm sure you understand this, but others may not realize that Linux is not, nor was ever intended to be a drop-in replacement for Windows of any vintage. It is intended as a freely available Unix work-alike although many efforts have resulted in some good ability to run Windows software through emulation.

> Until that happens with Linux I am locked into an XP machine and a

It's not ever going to happen in that manner. Linux is its own entity and does that very well, just like the Mac is its own entity. There are similarities between all systems, but again, Linux is not nor was ever intended as a bug-for-bug replacement of Windows capable of running Windows software unmodified. A lot of people, including myself, use Linux as our desktop and are quite satisfied with no Windows in sight.

I'm sorry if you were led to believe that Linux is a software compatible replacement for Windows. It's not.

Understood, Roy.

Besides being an emulator/program loader, Wine also has winelib which is intended as a way to recompile Windows applications for Linux (and other Free Unix systems like BSD, etc.) so they can run natively. This would avoid a complete porting effort.

One might ask, minimum for what? Coupling between antennas so that the receiver of one radio isn't destroyed by the other? That would depend on the power outputs and the receiver input power limit. Interaction so that the pattern isn't affected? Aside from patterns on mobile installations not being particularly normal anyway, it would depend on what's connected to the feedpoint of the "parasitic" antenna. And, is that a free space half wavelength or far enough that the phase of the near field has flipped 180 degrees?

And, as a practical matter, taking a sort of average, half a wavelength is about 5 1/4 meters or 17-18 ft. That's a fair distance apart for most cars.

So, let's surmise some practical details and try and help Fred out.. Say he wants to avoid putting more than 1 Volt RMS into the receiver, and he wants to use 100W on his 10m rig. Let's not worry about tuning precisely or grotty details of the car.. just 2 vertical monopoles 2.5 m long, 2 meters apart, with a 50 ohm load on one, and the source on the other.

With 100W (about 60Volts and about 1.7 A into the 36 ohm Z), you'll get 24 volts across the 50 ohm load. That'll probably cook it. Even if you ran 1 Watt, you'd get about 2.4 V... So 2m is a bit close if you want to run 100W.

Typically, it would the a set of measurements reduced to a descriptor of centrality and variability, eg median and percentile or inter quartile range or whatever.

I think it is intended to equate to the field strength that would be measured using a linearly polarised antenna oriented for maximum pickup.

The question comes up in a context of we amateurs measuring and documenting background noise levels, and whether the z, y, z -> S is better than just swinging a loop for maximum response and recording the measurement.

I am of the view that the three dimensional measurement is really a technique suited to automated measurement of a large set of frequencies with and instrument that has a single plane antenna that it cannot re-orient, and whilst it addresses that issue, it is unnecessary complication for a hand held loop that can be maximised.

But, my opinons are not very important, I am interested in any formal testing procedures, and the opions of other knowledgeable and experience practitioners like yourself Roy.

>
> After all, half the children in the schools are below average!

Not necessarily, it depends on the population distribution, doesn't it? Exactly half would be less than the median, provided there were an odd number of children.

Pickiness over averages aside, your comments are appreciated Roy.

>
> Dan

The structure, as shown on the web site, has the following parameters:

Gain at 10 deg. elevation -- 10.2 dBi
F/B ratio -- 5.5 dB
Input impedance -- 126 + j 171.

Ball park guess 2 element beam at the same elevation.
Driven element 28", reflector, 29.5", and element spacing 7".
Elements 0.2" dia. aluminum:

Gain at 10 deg. elevation -- 12.3 dBi
F/B ratio -- 12 dB
Input impedance -- 35 + j 38

All above simulations using NEC above a perfectly conducting ground.

Regards,

Frank

1651. I Built the 10m Sleeve Antenna

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-22 06:16:52 UTC
From: "Sal M. Onella" <salmonella@food.poisoning.org>
Message-ID: <rzaDh.5599$7d1.3036@newsfe12.phx>
Source record: 45715

It was a bust. <:-(

I used copper pipe -- 1-inch for the bottom quarter-wave element and 1/2-inch for the upper quarter-wave element. The elements are 8 feet, 1 5/8 inches long and at the feed point, the space between the elements is about three inches.

I put a piece of thickwall PVC inside the lower element as an insulator (per Cecil's advice) and slid RG-8 through the PVC to the feed point. I attached the coax shield to the 1-inch pipe and the center conductor to the 1/2-inch pipe.

This afternoon, a ham pal of mine used his MFJ antenna analyzer (model?) to test the sleeve. The VSWR was never better than 2.8:1 and exceeded 3:1 over much of the intended range of operation. He suggested than we pull the coax out and reconnect it as a more conventional dipole. Good idea. The VSWR dropped to a 1.3:1 best and didn't exceed 1.5:1 over the entire 10m band. As long as I keep the coax a few inches from the lower dipole element, everything's fine. Oh ... don't lean it up against the orange tree, either.

I think we might have extracted more information with his analyzer had we not been getting close to being in the dark. If the antenna is inductive, feeding it through a cap might pull the VSWR down to 1:1 at best. I know from my J-poles that this is the case -- not sure if it applies to copper pipe dipoles.

I have very few ideas for correcting the original sleeve design. Feeding one or both elements through capacitors comes to mind. Resizing would not seem to be appropriate, since the poor VSWR of the sleeve was still better at 10m than anywhere else.

73,
"Sal"
(really KD6VKW, anxiously awaiting Saturday morning, to present my CSCE's at the local VE session.)

And right you are -- I stand corrected.

Guess I was blinded by thinking of the statistician who drowned crossing
a creek which had an average depth of only three feet.

Roy Lewallen, W7EL

1653. tuned vertical vs center loaded ant

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-22 06:40:11 UTC
From: Ed <Huckleberry_REMOVE_@bigvalley.net>
Message-ID: <Xns98DEE6B63F8F0spectrumhogstarbandn@198.186.192.196>
Source record: 45717

I have a general question regarding the pro's and con's of two types of antennas to be used for fixed station operation from a motorhome.

Is there any efficiency advantage between using a super sized Texas bugcatcher type center loaded antenna about 18 feet tall, vs, a vertical pole about 23' tall that is tuned with either a manual, or automatic antenna tuner?

Either antenna would be mounted in same location, and use my best connection to the under-chassis as ground point for feed.

My primary operations are on 80M and 40M. Vertical is mandatory due to certain limited space parking situations.

Wow, I didn't know anything could compile Visual Basic 6 code for any operating system environment except Windows. How well does it handle Windows API calls? EZNEC uses many, many of them. What does it do about functions in COM and ActiveX files? Does it recompile those too? What about third party software in the form of COM or ActiveX files, which can't be recompiled due to lack of source code? Does it successfully substitute for Windows Registry operations?

Ive built a couple of these and from my experience the bottom pipe is not large enough, maybe 2.5 inches using rg58 coax. PVC may not be the best insulator for this either. Styrofoam is very good. Even then the lower section will have to be somewhat shorter than you would expect. Since you are experimenting try some RG58 with your existing antenna and mkae the change from PVC to styrofoam making the changes one at a time so you can see the individual effects. Also sweep the antena to find out its actuall resoant frequency.

Hi Bob,

What you describe here, and that which followed, is a problem of
either hardware (I design my own) or a perception of Fourier
techniques that is constrained to common applications.

The trick is one that is encountered quite commonly with RF designers
(and those Hams that actually practice the craft instead of being
appliance operators) - it is called mixing. Or to describe it with
more precision (as an audio crowd has a restricted meaning for the
term "mixing") heterodyning or modulating/demodulating. Simply put,
the data channel is pre-processed by multiplying it with a reference
cosine before being passed onto the FFT. (Although this sounds like
windowing, it is not.) Of course, the output of the FFT has to have
its units recast. In the old days, this was called "zooming" or an
arbitrary view of a single frequency encompassed by a span of far
higher resolution than that obtained from a simple transform. I would

quickly point out that the simple transform is still performed (same bin interval, same bin count), but it has been augmented.

This technique, plus a waterfall display, is useful in tracing down mechanical problems in journals, bearing races (with bearing run-out or ball defect) and bad gear meshes. It also relates to Hank's desire to test individual construction components in the guitar as all of these problems relate to a subtle data inflection that can be destructive in machinery, or discordant in music. The zoom feature can reveal these defects with remarkable resolution. As I said, the FFT as originally described can differentiate every note of an Hawaiian slide guitar. Perhaps I should have added the proviso: provided you use a synchronized tracking generator for mixing. However, given this can be done digitally (no one needs a hardware oscillator), no change in hardware is necessary. All the data that is needed is already there.

> www.daqarta.com
by the way, this seems to be a dead link. (later) I take that back, but it took a lot of retries over the span of an hour.

Further, it seems you have a lot of what I mention above covered in your pages, by parts, but none of them encompass the whole of "zooming."

And for your page on windowing, drop me an email if you would like to see some pascal routines embodying some very tight windows. These came from my time with HP whose chief engineer soon after departed for a chair at some eastern university.

Hi Frank,

Consistent with past experience with Art's designs, I threw away
2/3rds of it (OK 2 wires) and got 3 dB more gain. Do we blame Gauss
for the original poor performance? Does this validate Art's concept
of static electromechanical waves?

Art, if this is a typo (electromechanical waves), then how many other
typos inhabit your descriptions that corrupt your truths that come out
so tarnished? If we have to sit through another rendition of Hearts
and Flowers about us kicking cripples, stealing from blind newsboys,
defrauding widows, and getting our rewards taken away from us in an
after-life; then maybe you should get a season ticket to the new
moderated group where those soap opera tunes can be sung in their
castrati choir.

> on the ground?

Here are the minimum h-plane, r.m.s. fields required by the FCC for commercial AM broadcast stations of the various classes at 1 km, for 1 kW of applied power.

1) Class A: 362 mV/m
2) Class B: 282 mV/m
3) Class C: 241 mV/m

That value for a typical 1/4-wave vertical monopole with 120 buried radials each at least 1/4-wavelength is about 306 mV/m (regardless of frequency and the ground characteristics at the antenna site).

The theoretical maximum h-plane r.m.s. field at 1 km from a perfect 1/4-wave monopole over a perfect, flat ground plane is about 313 mV/m for 1 kW of applied power.

OK. So the demo at http://www.eznec.com/DemoEXE/EZWDemo40Inst.exe
which I downloaded at 2007-02-22 12:43 UTC includes those latest
changes? If so, I have to report that it would not run on either of
Ubuntu Dapper (April 2006 release) or Ubuntu Edgy (October 2006).

In both cases, I removed wine and its config files from my system,
removed my .wine directory and did a fresh install of wine before
installing the EZNEC demo.

With Dapper, I got "EZNEC can't be run on a network from a
workstation". I wasn't, but the home directory is network mounted
using NFS. The wine pacakge was wine_0.9.9-0ubuntu2_i386.deb.

With Edgy, I got "Run-time error '13': Type mismatch. The wine pacakge
was wine_0.9.22-0ubuntu3_i386.deb.

I'll try Debian Sid later. They have wine 0.9.30.

Please don't interpret this as a complaint. Rather, take it as the
beginning of a compatibility list. And I'm still hoping that the demo
I tested was out of date :-)

Ed
With a decent top hat, the bottom fed 24 foot will outplay the shorter antenna... For this installation the SGC auto tuner should work satisfactorily... I would go this route over the Bug Catcher, myself...

Consider some roll out radials clamped to the ground tap on the antenna feed for when you are able to lay wires across the ground - like after midnight... This will make a major improvement...

Rhetorical question?

> Does it successfully substitute for Windows Registry operations?

I'm sure it tries to, but I've never tested.

The Mono guys (.NET for Linux & friends) just announced support for
Visual Basic.NET. But I this is probably too different from old
fashioned Visual Basic to be of much help.

>Richard Clark, KB7QHC

Richard:

Thanks for your detailed post. I am aware of the "zoom"
approach, but have not implemented it yet. The cosine
multiplication down to baseband is the easy part; the part
that has put me off is the pesky decimating filter.

For others reading this, the basic idea of the zoom FFT is that
if you want to "zoom in on" some frequency region at
higher resolution, you multiply the incoming signal by the
center of the desired range. From that old high school
trig formula for the product of sinusoids, you get a bunch of
sum and difference components. So the center of the
target band ends up at 0 Hz since you multiplied it by a

sinusoid at the center frequency, and all the rest of
the original spectrum is now spreading out on either
side of 0. Now, if you low-pass filter this mess you can
re-sample it at a much lower frequency. The filter has
to be set so there is nothing of significance above half
of the new sample rate, just as for the orignal ADC (or
you get aliasing errors).

Then you take an FFT of the same size (1024 or whatever)
samples, but at the new lower sample rate. If the new rate is
1/100 of the original, the resolution of the spectrum is improved
x100. Another way to think about this is that if you only wanted
to zoom in on the low end of the spectrum, you wouldn't need to
do the cosine multiply, filter, or resampling... you could just reduce
the base sample rate to 1/100 (if your sound card permitted, and had
its anti-alias filters set for that) and get exactly the same results.

Note that this gives exactly the same resolution as an FFT that is
x100 larger, where you only get to see 1/100 of the whole spectrum.
Also note that an x100 increase in resolution takes x100 increase
in sample time, so you must insure that the signal is stable over that
interval or you will get spectral peak smearing... there is no free
lunch here! This is no problem for Richard's examples of bearings
and gear meshes, but I'd expect troubles with most music since
it is so dynamic.

Anyway, back to my original lament: The low-pass filtering and
resampling would be quite inefficient if done by conventional
approaches, but there are apparently some elegant solutions
that do both functions in one block, reusing it over and over
to get successive halvings of the sample rate. My problem is
that I have only seen this described in theoretical terms with
simple block diagrams, leaving the exact coefficients, etc, as
"an excercise for the reader". Searching the Web I find that
others are apparently as left out in the cold by this as I am,
and there is no example code, hints, or tips to be found.

So, until this particular reader either gets struck by a flash
of insight or takes the time to read up on this enough to
get a whole lot smarter, the zoom FFT is on a back burner.

(Richard, I'll Email you about those window routines...
many thanks for the offer!)

Best regards,

Bob Masta

Hello.

I took some measurements of an AM broadcast from multiple points up to about half a mile from the transmitter. The transmitter was supposed to be operating at 20W. I don't know what kind of pattern the AM antenna had, but can I just use the field strength readings that I got to predict how far the signal can go out? I only was able to measure 3 points, but I want to know if that is sufficient to make an estimate under the same conditions.

If so, how do I go about starting this? Are there any formulas? Also, on average AM receivers, what would be considered a minimum field strength value that would yield an audible sound?

I also read that frequencxies less than 2MHz rely on surface waves. Is there a site that I can visit that will give me an idea on how to take this into account given that there are different ground characteristics? Thanks!

Well, I am at it again... Came up with a new idea for the tuneable elements of an antenna matcher while awake at 3AM...(I think it it was the tomato sauce)
After thinking about it for a few days I cobbled up the device... Put up a half wave, end fed, 20 meter vertical and attached said device... Tuned it up with the antenna analyzer - nice 1:1... Put power to it with the MK-V... Nice and flat across the band... Fired up the Henry (which has a bad track record of eating things that are fed to it)... Tuned it up and it was idling along at 700-800 watts and everything seemed fine, soooo put the lash to it (4100 volts at 0.800 amps)... OOPs!

Say did you know that teflon contains carbon black? I mean lots of carbon, like thick clouds of it?... Hmm, apparently the RF voltage across a tapped coil (think autotransformer) exceeded the 7000 volts the teflon was supposed to withstand... Well, we dissected the parts... The metal is salvageable and I have more teflon.. I will double the thickness for the next test... As we were turning out the lights and leaving I looked back at the Henry... I could swear the plate meter winked at me...

Here's what I was taught. In the Northern Hemisphere,
the Northernmost point in a body of water at rest is
moving slower than the Southernmost point. Consider
that the ocean water at the poles travels pi*zero miles
every 24 hours while the water at the equator travels
pi*8000 miles, i.e. about 1000 miles per hour. The extra
velocity of the Southernmost molecules is what gives the
counter-clockwise rotation of a fluid in the Northern
Hemisphere. In the Southern Hemisphere, the Southernmost
molecules are moving the fastest resulting in a clockwise
rotation.

They can be quirky..And the decoupling is pretty critical. I always
preferred
a base fed half wave for those reasons. You still need to decouple for
best
performance, but there are no "coax in the way" issues, etc.. I use a
simple
"gamma loop" feed. IE: single turn coil, and a cap if needed.
Sometimes
you don't need the cap, but if you do, 30-50 pf is about the usual
value for
10m. I make those from a short length of coax.. I'm basically copying
the
feed system of the usual cushcraft ringos.. BTW, cushcraft sells a 10m
ringo if one doesn't want to build one, or have the tubing.

An estimate is possible, but assumptions will need to be made. If you can post the readings you got, the path lengths, and the general location for the transmit site I can give you some idea about that.

Of course if you can post the call letters of the station then the FCC data for that station will show they should be.

The FCC publishes charts that may be used for this purpose. As for minimum usable daytime field for a typical, cheap indoor receiver in an urban, residential area, a value of 1 or 2 mV/m typically is needed.

No, no, no, never. Just ask the parents, the school boards, the principals, and the kids. At least 95% are above average. Using a 4-point system (A=4 and so forth) they graduate with averages above 4.0 and with multiple valedictorians (so no one will be hurt).

Thank you for the specs...i am concerned about the radiation pattern of the
"driven antenna" or the antenna of the radio I am using at that moment...i
will never use both at the same time. I am looking to make them as
omnidirectional as possible. I seem to remember somthing about a firgure 8
configuration. (I used to know this stuff, but I have forgotten it.)
Note: there is a half-wave two meter antenna present as well.

The readings that I got were 3.1 mV/m at 15 meters away. 1 mV/m at
0.32 km away. Finally, 0.71 mV/m at 0.80 km away. We traveled a
straight path that was parallel to the direction of the antenna. It's
not an FCC station, but my professor got permission to test it briefly
at 1.79MHz. I don't know the exact area that we were located, but it
is somewhere east of Magdalena, NM.

Thanks! I was curious about AM stations at one time and looked up some
FCC data. I noticed that some stations have lower power output during
night time compared to daytime. For example, one station had 1 kW
during daytime and decreased it to 300W (I think) during night time.
Does that indicate that night time propagation is better?

If the building steel weren't grounded, you'd have serious damage every time a thunderstorm came along. The building would get struck by lightning and then it would have to make a path to ground SOMEHOW. Often, static charges could build up just from wind blowing past a building. Can you imagine the static discharge of a whole building against some poor slob who happens to touch it by accident? It would be deadly...

In any case, most building standards I've heard of do require building steel to be grounded.

Night propagation is complicated by the existence of a strong sky-wave
reflection from the ionosphere's E and F layers. In the daytime, the D
layer absorbs emissions at these angles. Hence the need to reduce power
at night to avoid interference with more distant stations' ground wave
coverage.

Your description resembles a "Part 15" type installation more than the broadcast system of your first post. Here are some general statements about how a compliant Part 15 AM system might perform.

Antenna engineering textbooks, NEC calculations, and thousands of field strength measurements made in the broadcast industry over the last 75+ years show that the maximum field strength in the horizontal plane that is produced by a vertical, 1/4-wave monopole with 1 kW of applied power over an almost perfectly conducting, flat ground plane is about 300 millivolts/meter (mV/m) at a radius of 1 km (0.62 miles).

A legal Part 15 AM tx that was 100% efficient, and used with the above antenna system would generate a field at 1 km that would be reduced by the square root of the power difference, or to a field of 3 mV/m in this case.

But a 3-meter, ground-mounted Part 15 antenna system is only about 1% as efficient as a 1/4-wave broadcast radiator system. So instead of radiating 100 mW, the Part 15 antenna system radiates around 1 mW. That leads to a further reduction in the field at 1 km by the square root of 100, bringing it to about 300 microvolts/meter (ï¿½V/m).

Note that all of these fields assume an almost perfectly-conducting ground over the propagation path. Typical ground conditions are far from perfect, so the fields at 1 km would not be even this high.

By broadcast standards, a 300 ï¿½V/m field is very marginal in providing a usable signal to a typical, cheap AM receiver located inside a home. And every doubling of the distance decreases the received field by more than 50% (including ground losses).

From this information it can be seen that claims of "legal" Part 15 AM coverage extending for a radius of 2, 3 and 4 miles cannot be realistic, unless the system is not meeting Part 15 limits.

Hi Owen,

It sounds like you want a Black Body Absorber.

You might want to take your lead from that if you are building
instrumentation (the purpose of your data reduction).

Presumably you would also want it to be isotropic in sensitivity. If
my speculations are correct, the simplest method would be caloric
based, but the trick would be to get it to occupy a volume of space
AND present 377 Ohms; but then how would you shade if from the sun
(another notable field presence that would innundate your detector);
or if done at night, how would you cope with the infinite heat sink in
nearly half the field of view? Most caloric methods employ a bridge
configuration that balances out these disturbances.

So, the simplest method is not very simple at all. Compare it to the
more difficult methods and you may wish for it after-all.

Don't know much about "Part 15" is that something that I can find in
the CFR 47? http://www.access.gpo.gov/nara/cfr/cfr-table-search.html

How did you get 3 mV/m? I tried 300 mV/m / (sqrt(1kW - 20W)).

Thanks, Richard!

I don't have the experience background, yet. But in your opinion, is a field strength of 1mV/m the absolute minimum for decent AM reception? Also, is the fact that AM more prone to interference the reason why its field strength requirements are higher than FM?

1681. Shielded loop operation

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-22 20:23:49 UTC

G'day all,

I am trying to work through the magical claims that are made of shielded loops. My interest in mainly their use for field strength measurement, but understanding them in a general sense is the place to start.

I have not found a detailed description of operation in my text books. The ARRL does contain information, but it is inconsistent and IMHO sometimes just plain wrong.

I have drafted an article with a proposed explanation of the operation of a small single turn untuned shielded receiving loop. The article is at http://www.vk1od.net/shieldedloop/index.htm .

Am I on the wrong tram?

Comments appreciated.

Owen

"MRW"
>How did you get 3 mV/m? I tried 300 mV/m / (sqrt(1kW - 20W)).

Other things equal, the far field varies by the square root of the power change.
If 1 kW into a given antenna system produces 300 mV/m at 1 km, then 0.1 W into that same system produces SQRT(0.1W / 1000W) x 300 mV/m at 1 km, which is 3 mV/m.

>Are there any existing resources that talk about how much attenuation
>can each ground type contribute?

The FCC charts probably are the best resource. Surface wave propagation losses are dependent on frequency as well as ground conditions.

>I don't have the experience background, yet. But in your opinion, is a
>field strength of 1mV/m the absolute minimum for decent AM reception?
>Also, is the fact that AM more prone to interference the reason why its
>field strength requirements are higher than FM?

A good AM receiver in the absence of natural/man-made interference can produce useful (but not highly "competitive") performance in fields of less than 100 ï¿½V/m.

At a given value of received field strength, an FM broadcast is received with less noise than AM because of the lower noise level at VHF frequencies, and due to the ability of an FM receiver to the reject the a-m noise that is present.

Hi Bob,

What you want to resource here are the printed materials available
(then) from the manufacturers of analyzers in the time span of 1980 to
1986 or so. Those would include Analog Devices or Hewlett Packard,
both of which had superb application notes that went to considerable
detail. The academic treatments of that era were mostly semester
based fluff introducing concepts, and not many at that. Industry was
the best source for actually grasping the concepts and implementing
the details. Soon after this period saw the introduction of DSP which
is a silicon processor equivalent of the IIR or FIR math (resource
Texas Instruments from that slightly later era for this discussion).

You did quite well in describing the "zoom" process. This hallmark of
the Real Time Audio Analyzers designed by HP 20 years ago was a long
time in coming. They had a 16 member design team working with a
million lines of Pascal code. It took them 5 years to develop the
product in contrast to the HP design cycle of 18 months. They also
had to design their own Pascal compiler.

I would recommend for reading those works from the Program Manager
Nick Pendergrass (Google: "nick pendergrass" fft).

I have WordStar 6.0 running on linux (under dosemu.) The last time I
ran WordStar in a micro$oft environment was probably around 1991.
That's when I cut over to OS/2. Starting around 2002, I started making
the transition to linux. All linux now. I keep the OS2 box for
nostalgia.

With regard just to your last question, atmospheric (mainly from lightening around the world), galactic, and typical man-made noise are all much higher--40dB or more, usually--at 1MHz than at 100MHz. You need signals above the noise for practical communications. (Bandwidths also enter into the picture, but I believe the noise is the key issue.)

Cheers,
Tom

Hi Richard, I was not really serious, but at least wanted to demonstrate
that a simple 2 element array outperformed the fictitious antenna which
must be machined to within +/- 1 micro-inch. I assume it is some kind
of joke, and particularly liked the description of orbiting helium nuclei;
also the presence of beta particles. The elements must be partially
radio-active.

Sorry about the lost closing quote. Here is the offending paragraph with
the quote fixed and a fuller reference:

====
Another figure in the ARRL Antenna Handbook 18th Edition, p5-6 Fig&#65533;8
contains the note "capacitance from shield to conductor is uniform around
circumference". The capacitance from the inner of the outer conductor to
the outer of the inner conductor acts entirely inside the transmission
line and has no effect on the external balance of the loop. The
conditions on the inside of the loop outer conductor are isolated from
the outside of the conductor due to skin effect as described above.
====

Does that clarify it. It is not the greatest bit of prose, but is it
clear enough?

Re the effectiveness of skin effect in isolating the inner and outer, I
agree that it isn't perfect, and less perfect in the case of braid than
for a solid tube. However, even through braid leakage is small relative
to the coupling through the gap as I describe, so the error in
simplification seems small to me.

Thanks Richard.

So in terms of the 20W test, this value at 1km would be 42.4 mV/m? If
so, how would I translate this value to another distance (e.g. 0.4 km
away)? I'm assuming that it would be greater than 42.4mV/m.

Would a typically AM receiver be able to pick up signals 50 uV/m in
field strength? I'm assuming that it wouldn't since the components in
the AM receiver have noise levels probably close to this, huh?

Thanks, Tom! I did not know about this noise factor in this lower
frequency range. In a way, if I were operating at 100MHz using AM,
then I should be able to work with lower field strength values?

1691. Re: EZNEC and Linux

Newsgroup: rec.radio.amateur.antenna

Thanks for the info. Since there's apparently no version control or "standard" version of Linux or wine, I guess it's not really appropriate to claim that "EZNEC runs on Linux using wine". My statement was based on a single report, from someone using wine 0.9.2 with linux kernel 2.4.20-42.9. But even no two Windows installations are the same, so I'm sure this is true for Linux also.

I've never purposefully set out to make EZNEC run under Linux -- the market is much too small to justify any but the most minimal of effort. The current state is, as I said, a result of a change made to make it work under Vista, plus one small change to get around an apparent wine bug (it handles the Windows API call WaitForInputIdle incorrectly). I'll continue to make very minor changes if necessary to accommodate various bugs in wine, but nothing major I'm afraid.

60m operation is limited to 50w pep relative to a
1/2WL dipole. Since a typical 60m mobile antenna
would be much less than 50% efficient, seems it
would it be OK to run an IC-706 at its normal 100
watt output level. Am I reading the rules right?

Hi Frank,

Neither is Art - only passionate.

His being convinced is one thing, but it does nothing to convince others - except for possibly two more like him on Golgotha. Inevitably whenever anyone like these two try to chime in, Art pounds more nails into them.

Art, you can certainly name your critics, and you aren't shy to enumerate huge lists either. Can you name one poster who can explain your web page here? It would certainly make for a fresh change - like the polar cap expanding back out or the Greenland glaciers returning.

Problem here is Art offers this as "PROOF." I note that no one has bothered to point out that proofs necessarily have a premise to be proven. When we have to dig for the premise, does it become OUR proof? Or does the original author then expand his chest and proudly proclaim "That is what I meant to say!"

When I examine the page at its most fundamental facts, namely that described as "THREE ELEMENT GAUSSIAN CLUSTERED RADIATING ARRAY" I find that the picture of the elements is not the same as those described as the elements. A simple glance reveals the two at the top of the illustration are orthogonal to the X axis, reviewing the coordinates proves none are. There is a proof for all that is easily demonstrated.

When I review the claims of "drive impedance" I find element 1 claims to be resonant at 200 MHz when it is only 5 or 6 inches long. It doesn't take computer analysis to destroy that proof. It doesn't work if the length is in inches, feet, meters, centimeters, yards, chains, rods, or any "usual" form of linear measurement.

These being technical details, appropriate for discussion in a technical forum, they will sit cold on the table while flagons of passionate wine are splashed around filling cups of remorse against our failure to acknowledge genius.

What are the actual words used in the rules?

If this is based on ERP, and uses the term Effective Radiated Power to mean relative to a dipole (rather than say, EIRP), then the ERP would be calculated from transmitter power output and antenna gain wrt a dipole, or

ERP = TxPower*AntennaDirectivity/DipoleDirectivity*Efficiency.

So the terms you left out were AntennaDirectivity and DipoleDirectivity, but I should think that most HF whips would have Directivity lower than a dipole, so you may be ok.

I think your interpretation is correct, but the key is:

"A half-wave dipole antenna will be presumed to have a gain of 0 dBd.
Licensees using other antennas must maintain in their station records
either manufacturer data on the antenna gain or calculations of the
antenna gain."

Meaning you probably need to keep an EZNEC printout in your glove
compartment. ;-)

1696. "Noise" antenna for MFJ-1026 "Noise Canceling Signal Enhancer"

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-22 22:56:45 UTC
From: Eric <reply.in.group@nospam.no>
Message-ID: <pan.2007.02.22.22.56.42.943428@nospam.no>
Source record: 45610

I have the MFJ-1026 what they grandly call a "Deluxe Noise Canceling Signal Enhancer" (as contrasted with the plain old non-deluxe version, I guess).

The main station antenna is a 160-meter inverted vee up about 40 feet and fed with ladder line, used on all bands 160-10. The noise antenna is an 80-meter dipole up about 20 feet, fed with coax, and oriented about 60 degrees off of the plane of the inverted vee.

There are times when the noise canceler works really well, and other times when it works hardly at all. I know that when you get noise from all directions, there isn't much an active noise canceling device can do about it. Still, I'm wondering if there is something I can do to make it work better.

Is there another kind of noise antenna that I could use that would work better a larger percentage of the time?

Someone told me that an active receiving antenna (a relatively short whip with a preamp that's mounted at the antenna) could work better, but I'd need something that's broadband through the 160-10 meter range that wouldn't have to be tuned.

Any suggestions? Thanks...

It is your failure to acknowledge what it actually is that is most remarkable. A visit to Art's website tells the story. Little more need be said, for that would quite literally be kicking the crippled man. Consider what John Bradford had to say, Richard.

1698. Random-length loop antenna for 160-40?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-22 23:08:09 UTC
From: Eric <reply.in.group@nospam.no>
Message-ID: <pan.2007.02.22.23.08.06.786556@nospam.no>
Source record: 45611

I just took a little survey out in the back yard, with a thought towards putting up a loop antenna as large as I can and feeding it with ladder line and an autotuner.

It looks like what I can probably do is manage about 250 feet in length and about 50 feet between front and back, so that it goes nominally 250 feet by 50 feet by 250 feet by 50 feet, and will be fed at about the 100-foot point in one of the 250-foot legs.

In fact, the loop will be really irregularly shaped, but on average the 250x50 dimensions will probably be not too far off.

The whole thing will be up about 25 feet off the ground (that's about as high as I can reach with my extension ladder and I really don't have any practical way to get it up any higher).

The plan would be to use it mostly for NVIS work on 160 through 40 meters, though if it'll tune up on the higher bands I'll probably use it there too, from time to time, for whatever good it will do.

What do you all think of my chances of being successful with this antenna vs. my current 180-foot-long ladder-line-fed inverted vee?

Any truth to the story that "closed" antennas like a loop or a folded dipole are less noise-susceptible that plain two-legged dipoles?

5/8 wave on 156 MHz is 47.3 inches (rounding). Seems like whipping up
one of the classic SO-239 connector ground plane antennas out of some
brazing rods would be a super cheap way to do it, then you don't have
to worry about counterpoise and you haven't taken more than about $10
out of the antenna fund.

Hi Ed,

I agree with Denny 100%. Any loss in a tuner feeding the 24 ft vertical will be less than that in the Bug Catcher. The major loss in the Bug Catcher is due to the resistance caused by the turn-to-turn capacitance that makes the inductance resonant at some frequency not too much higher than that that at the operating frequency. See the resistance vs frequency curve of a parallel LC circuit, where you'll see that the value of resistance is maximum at resonance, which is not what you want at anywhere near the operating frequency.

That is the way I see it. The 1/2 wave dipole would be the 0 db refferance point. I doubt any practical antenna on a car would be anywhere near 50% of a dipole.
YOu seem more able than most to calculate the number of db below the dipole so you can calculate the ammount of power you would have to run to get up to the same level of the 1/2 wave dipole. I am not sure even the legal limit of 1500 watts would get you there with some antennas. Maybe the 1500 watt rule does not apply on this band if you have a very poor antenna.

1705. Aluminium for antenna design

That's fine. I was just trying to clarify the position of Linux in relation to Windows. I'm afraid that at times those of us that do advocate Linux are not as clear about it as we should be. It would be fantastic if there was some magic OS that ran everything. Wait a minute! Linux is almost there! ;-)

I have played with WinDRM and some of the Antenna book software with Wine. I have also used Morse Runner with Wine and it's great fun.

> sure this is true for Linux also.

Good clue there Roy. The -42.9 would probably indicate that it is Redhat or Redhat clone. I don't think anyone else uses that extended kernel numbering format. The official kernels are almost always x.y.z, with the rare special minor fix as x.y.z.a. The 42.9 signifies the Redhat patch set applied, which often has nothing to do with official releases, or sometimes it upgrades one kernel partially or completely to another, unspecified, kernel. Redhat kernels are very confusing, misleading, and have there own special bugs. This 2.4.20-42.9 may actually mostly be 2.4.27, 7 versions newer. But you'll never know.

The "standard" in Linux is actually the kernel itself. The distributions are the packages that surround the kernel. This includes the desktop and all the other software that comes with the distribution you install. Kind of like the VW bug engine and chassis and tons of parts kits available. Except Redhat insists on changing random parts on the engine, boring a 1600 out to 1950, and still calling it a 1.6 liter.

Before I am attacked, I am NOT running down Redhat here. I use Fedora Core 6 at work, and am quite happy with it. As a desktop. As a server platform however, their silly kernel numbering system often makes it very hard to know how their kernel features map to the Linux standard kernels. And when I need to be sure a piece of hardware such as a particular SATA controller or SCSI RAID is supported, I am forced to build a new kernel from scratch from a standard kernel source release. Not hard, just a pain that would be alleviated by Redhat sticking to the rules the rest of the distros (most) stick to.

But nucleus and electron would be much clearer to the reader.

> I do not wish to represent myself as a physicist.

Don't worry, you don't.

It is clear you don't know how electricity flows in a material.

Your example of the balls on the string is wrong. You state that under high magnification the middle balls do not move. If this were to be true there can be no energy transferred from one end to the other. This is a simple example of elastic collisions and conservation of momentum. High school physics covers this material.

Your concept of electrons leaving the surface and returning at anything other than significantly elevated temperatures is fantasy.

You make the extention of Gauss' law to include time. However, from what I know, Gauss' law applies to electroSTATICS. If this can extended to include time, and you are the first to observe this, then some sort of rigorous proof would be appropriate.

You might want to look at a basic book on electromechanics. You need a better grasp of the fundamentals

To advance science, you would need to provide your evidence in a manner that could be validated by those knowlegable in the fields of physics and electrodynamics. However, looking at the first half of your page, there is nothing but analogies that are not applicable to the concept you try to present. Actually the facts you try to present are just plain wrong.

> You are obviously out of touch with respect to antennas by

> ficticious which you never explained.

What theory? Your starting point contains so many misperceptions that nothing points in a direction that would lead a reader to believe whatever follows.

You require 'equilibrium' to satisfy your concept at every step of the way. However an antenna is driven from a transmitter. This input energy would tend to eliminate any state of equilibrium. Your initial statement of moving charges in a material and applying Gauss' law and requiring equilibrium doesn't work. If the charges are moving, where is the equilibrium? (You also never define equilibrium therefore any assertion of equilibrium is meaningless. Nobody can tell what you are talking about.)

> Give me something for the record

Hi Owen,

I have no time at the moment to read your draft, but I can tell you that there is a very good qualitative explanation in King, Mimno and Wing, "Transmission Lines, Antennas and Waveguides." I have a PDF of the antennas chapter... I also know that in Johnson and Jasik there's a corresponding explanation with a bit more detail. In a nutshell, in the so-called shielded loop antenna, the antenna is the outer surface of the outer conductor, and the feedpoint is the gap in this conductor. The center conductor is merely a transmission line to conduct the signal from the feedpoint to where it is used. It is balance that yields the "magical properties," and it is possible to build an antenna with good balance without making the loop out of coaxial cable. The magical properties are generally taken to be rejection of nearby electric fields (not electromagnetic fields), and a symmetrical pattern.

Cheers,
Tom

Yes, to be sure. It's interesting to note that communications in the aviation band above 108MHz is, AFAIK, still all AM. The nav signals are different but voice communications are AM there.

The "noise" chapter of Sams' "Reference Data for Engineers" has some info on noise versus frequency, from various sources; included are a map of usual atmospheric noise levels around the world, and I believe sky-maps of galactic noise. You can also find some of that on the web.

A more up to date source of expected ambient noise levels is ITU-R
Recommendation P.372-8. I have summarised some of the info from that
document for HF frequencies at http://www.vk1od.net/fsm/FSAmbientNoise.htm
.

TKS. I will try both of those approaches. BTW, The PVC wasn't chosen for
its electrical characteristics. I used it only as a physical separator to
prevent arc-over. Styrofoam, eh?

The analyzer permitted sweeping, albeit manually. The resonant freq is
where it ought to be and it tests OK with the coax out of the lower section.

Agree. However, the venerable Kenwood TS-120 says to keep the VSWR under
1.5:1. So, my first attempt is a bad antenna for the intended purpose.
>
> Did you do anything to choke the common-mode
> currents on the feedline? If not, those currents
> can upset the SWR meter reading.

No. That was careless of me. Four turns of the coax if I remember
correctly from an earlier discussion here. Thus, the first attempt may not
be a bad antenna but a bad measurement.

I will try decoupling and also try that feed.

I have several commercial antennas but I tend toward building them myelf. I learned the hard way about the three types of copper pipe, K, L, & M. Until I got home and hit google.com, I didn't know to shop for the more economical Type M and paid premium $$$ for Type L. I don't want to think what Type K would have cost.

I'm not so sure. A 24ft vertical is about 0.18 wavelengths at 7MHz, and about 0.09wl at 3.5MHz. It will require a large series inductance to resonate it at 3.5MHz, and will also require some series inductance for 7MHz.

That inductance must be provided by either an external loading coil or by the auto-tuner. The question is: which will have the smaller loss, a large and well designed external coil, or the tiddly little toroids inside an auto-tuner?

Fair enough, but a loading coil doesn't always have to be built that way. This one has no requirement to catch bugs at 60mph.

I would suggest the 24ft vertical and auto-tuner by all means, but use a well constructed outboard coil to provide the major part of the loading, and leave the auto-tuner to handle whatever impedances result.

Without analysing it in detail, it would probably be best to load the whole thing to resonate just above 4MHz. At 7MHz the feedpoint impedance would then be considerably inductive, but the tuner can probably deal with that more efficiently than if it was asked to provide all the loading inductance itself.

Another alternative, avoiding the auto-tuner completely and therefore much less expensive, would be EI7BA's homebrew version of the Butternut HF2:
http://ireland.iol.ie/~bravo/80&40mVertic.htm

But whatever you choose, it's got to have "radials, radials, radials", exactly as Denny says.

In your situation you can never come anywhere near the optimum number and length of radials, so simply aim for as many and as long as you can. On the ground or just below the surface, whatever lengths you can practically manage will be fine.

Hi ,
I think you'd like the loop , Though it is about 250 short for good
efficiency on 160M I run a 256 foot 80M loop here fed with home made
open wire line works great.
try it and enjoy.

YES! You are reading the rules correctly.

There are many 60 meter mobiles running 300 to 400 watts into a 10% efficient antenna relative to a 1/2 wavelength dipole.

Get on 60, It;s is a great band.

the normal alloys used in the states are 6061-t6 or 6061-t832(i think that is the right heat treatment number for the other one... t6 is more common i believe). and don't weld, use swaged or telescoping joints, welding destroys the heat treatment effects and allows for dissassembly when needed. use decent all stainless steel hardware and liberal applications of anti-oxidant compounds on all joints.

Hmmm, one could go to Terman, et. al... Lots of heavy math... ughhhh
One could ask the mobile whip manufacturer what the relative gain of
his product is - On second thought that's unlikely to get an answer
other than 42... (See: HitchHikers Guide To the galaxy)

Or one could do the bone simple, farm boy stupid, yet amazingly
effective method of comparing the relative length of the mobile whip
to a quarter wave vertical...
First, the quarter wave vertical is half the length of a dipole so you
immediately have a multiplier of 2...
(Awwww right you nit pickers, DOWN! - Yes I know about vertical-P
loss compared to horizontal-P, but I'm farm boy simple for this one)
Assume the 1/4 Lambda vertical is 45 feet (rough number, I'm a farm
boy, remember) and the whip is 8 feet... Then 45/8 = 5.6 ratio...
So 2 times 5.6 = 11.2 ratio so far...
Therefore 11.2 times 50w = 284 watts...

Now the efficiency of a mobile whip that is just over 20% tall (of a quarter wave) is roughly 8%-10% (swag) Lets call it 10% for rough numbers therefore we can expand the 284 watts by dividing 0.1 into it... or 2840 watts.... Which will make your IC-706 sweat a bit...

OK nitpickers, have fun...

Kind of like asking what is the best combination of qualities in a pet.

Depends on what you mean by "cover" and "best".

If you mean better than no antenna at all, then the dipole would
probably work, although it will be very directional at the higher
frequencies, and depending on the impedances involved, its response will
not be uniform across your target spectrum.

A vhf/uhf discone would be omnidirectional, but you said nothing about
the importance of directionality (in either the vertical or horizontal
planes) or of gain.

You have not mentioned whether any devices might be inserted between the
antenna and the receiver to effect a reasonable impedance match.

Inexpensive scanners often use a single (active) antenna to cover that
kind of range. In which parameters do you seek to improve on simple
scanner antennas? Sensitivity? Bandwidth? Directionality? Local noise
rejection?

> by the auto-tuner. The question is: which will have the smaller loss, a
> large and well designed external coil, or the tiddly little toroids
> inside an auto-tuner?

I was kind of thinking the same way.. In general, I would usually
prefer
the larger coil, even with it's problems.
I think a larger part is the top loading, if used.. If no top loading
were used
for the 24 ft whip, I could see it being a toss if the loading coil in
the tuner
was small and rinky dink. It could easily lose to the center fed if
the tuner
is poor.
But then you also should consider current distribution through the
whip.
Can make quite a difference. If the 24 ft whip was fed with a tuner,
and
no hat was used, max current will be at the tuner coil.. Not really a
good thing.
But adding the hat will greatly improve current distribution through
the
whip, and pretty much cure that problem, assuming the hat is large
enough.
If no hat is used, I would always prefer a center loading coil. Mainly
for
current distribution reasons. But also cuz many tuners are overly
lossy
when used in such a manner. Note comparisons with a tuner fed whip on
a
car, vs a good center load antenna. In the average case, the tuner
fed
whip will be about 12 db down according to the mobile "shootouts".
As far as coil Q, 1000 is going to be pretty optimistic... 300 + -
would be
more easily obtainable.. And thats a pretty decent coil.

If ground radials are ignored, ground loss could easily swamp the coil
loss.
Of the two losses, I'd be more worried about ground, than coil loss.
But thats just my 29 cents worth...

I agree. There are no magic properties to a shielded loop. All the
design
does is to ensure balance. I've done careful tests comparing a
shielded
loop, vs a good unshielded loop. I could not tell a lick of
difference.
It's all in the balance. An unshielded loop can be just as good, if
the balance is good. And thats not hard to achieve. If I really
thought
shielded loops were better, I would use them. But I don't, so I
don't.
I have a 44 per inch side unshielded loop right next to me. "5 turns"
It's my best loop of the bunch I have tried, and it's the one I stuck
with. BTW, I have also tested using shielded loops as the "coupling"
loop. Again, not a lick of difference being both versions of mine were
well balanced.

There are two easy methods and one rule of thumb method that will get you into the ballpark.

1) As Cecil replied, divide the radiation resistance by the feedpoint resistance. EZNEC will give a reasonable value for radiation resistance and an MFJ 259B [~$250] will give a measure of the feedpoint resistance.

2) A freeware program, mobile antenna, will also calculate the efficiency.

3) [Rule of thumb] The gain is proportional to the effective aperture in square wavelengths. So, as mentioned in another reply, approximately, the ratio of length of the mobile antenna [~8 feet] to the length of a 1/2 wavelength antenna for 60 meters [~93 feet] yields 8.6% efficiency. So, 100 watts from an IC-706 [series] yields ~9 watts effective radiated power. Conclusion, 50 watts ERP on 60 meters with a 9% efficient antenna would require 555 watts into the antenna.

Well, I may have stretched the Q factor a bit.... but in looking at
the following site, I would suppose its possible....

http://www.texasbugcatcher.com/cata/tbcspec.htm#6inch

scroll down until you view the #680 coil and read his text below.
That is what I had in mind if building a center loaded vertical. I
would not use a top hat in my case.

Per other comments in this thread, I see that perhaps I may get best
performance by using a combination of center loaded for 4MHz and using a
tuner for 40... and maybe 60. I'm really not interested in any other
bands.

As for radials, remember, even though intended for fixed station
use only, this is still a mobile antenna, and my RV parking situation
in many crowded spaces will preclude the layout of radials of any
significance.

Thanks for all the "food for thought" on this.

It certainly is ROT that in the general case, and in this case, that you
can run a tape measure over an antenna to calculate the aperture area and
in turn calculate gain.

Can you explain how your method deals with capturing the effects of a high
loss loading coil vs a low loss loading coil in such an antenna?

Owen

I'll rely on the calculation from the freeware program "Mobile Antenna". That program allows variation in coil designs to be specifically input as a variable.

If you have a better answer or method then please provide it.

The original post is basically asking if 100 watts can be run from a 706 in a 60 meter mobile. The answer is YES. Why? Because an eight feet long antenna is substantially less than the reference dipole. [Typically it is -10dBd].

Sal, I would like to know how it works with the PVC as I have tried it
on exactly this type of antenna and it worked horribly. Apparently the
PVC I was using has some really lousy dielectric qualities, This stuff

would melt in a microwave while other PVC pipes do not.. I understand that all PVC is not created equally and that some may be OK. To get mine to work I used larger pipe, smaller coax, and a different insulating material but my original was identical to your first attempt. Unfortunately for me I made all the changes at once and really dont know which fixed the problem except that the PVC was an issue. I am very interested in finding whether or not just adding the choke fixed the problem because this is also something I forgot to do on my intial attempt. Second attempt had one of those chokes from "Wireman" made of a length of coax and ferrite beads. One thing that concerned me even after the antenna was working is the the SWR appeared to be a little too good. It was 1.2:1 in the middle of 10 meters and never got ave 1.7:1 even at the band edges. I thought that this is a little too good to be true..

This has been mildly, but sadly, amusing. However contorted the actual
antenna might be, the obvious problem is in the premise that somehow
Gauss' Law has been overlooked in the past.

To keep it simple, Gauss' Law is precisely one of the four standard
Maxwell Equations. Gauss' Law has been part of electromagnetics and
antenna theory for eons.

As for electromechanics, who knows?

I am guessing that as an armchair operator, you would use a commercial
antenna.

Given your licence conditions on 60m, it would be very reasonable to ask
your supplier for a written statement (that you can file to fulfil your
licence obligations) of the gain of their antenna in installations like
yours so that you can calculate the maximum input power allowed. If that
is too hard, perhaps a written statement of the permitted maximum input
power for compliance with the licence.

Some of this in tounge in cheek, I just can't see antenna manufacturers
'fessing up to a range of gain figures for typical HF mobile antennas /
installations.

In time, the regulator will wise up to the challenge and specify things
more simply, eg if you use an antenna of less than 8' in length, you can
run up to 100W, otherwise up to 50W. That is more understandable to our
(eg VK) new six hour hams with their shack on their belt.

> is -10dBd].

For a 10' whip, EZNEC says the radiation resistance
on 60m would be ~1.3 ohms. Doubling that for center-
loading yields ~2.6 ohms. Dividing by an estimated
feedpoint resistance of 20 ohms gives an efficiency
of about 13%. Assuming an efficiency of about 90% for
a 1/2WL dipole, I should be able to run
50w*90/13 = 346w. 100 watts should certainly be
justifiable. Heck, I might even fire up my SG-500
at 300 watts. Now the next question. Is anyone using
60m?

1749. smith charts and network analyzer ?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-24 01:12:48 UTC
From: dansawyeror <dansawyeror@comcast.net>
Message-ID: <isydnePz3e6PDELYnZ2dnUVZ_t6qnZ2d@comcast.com>
Source record: 45563

All,

This is a follow up to a dialog several months back on impedance measurements. The question relates to smith charts and an HP 8407a with a polar display. I was under the impression that the polar display and the smith chart were pretty closely related. In fact hp made smith chart overlays for the screens.

The smith chart predicts a variable capacitor connected across a source will be represented by an impedance semicircle in the capacitive domain, one of the points on the semicircle passes through the 50 ohm center. I would expect to be able to create this using the 8407.

The 8407 creates a circle around the outside edge of the display. It is a circle, however it does not pass through the center.

Why are these different? What above is incorrect?

thanks - Dan

The 50 ohm centre is on the R=50 circle and the X=0 arc (which is
infinitely large in radius, so it is the the diameter from R=0
R=infinity).

Sit down and plot a few values of Z00+jx on a Smith chart, aren't they
all on the outside edge of the chart (the R=0 circle).

The horizontal center line on a Smith Chart is resistive.
The outside circle on a Smith Chart is reactive. A
capacitor is almost purely reactive. The reactance is
1/(2*pi*f*c) That value will always fall on the
outside circle of the Smith Chart. If the capacitor
has a reactance of 0-j50 ohms, it will be located on
the outside circle at the very bottom of the Smith
Chart normalized to a 0-j1.0 value.

Thank you, that is consistent with the analyzer. The smith chart program is in error.

The analyzer also shows the response of an open coax to follow the same circle at the edge of the chart. Is this accurate? The analyzer does not correct for length, is this a result of that?

Dan,

Perhaps a better way to understand a Smith chart as a visualisation tool
is to understand the Smith chart as a problem solving tool.

If you want to follow that path, print of a page or three of Smith chart
and plot solve some typical problems (without the aid of a computer
program), think about what the arcs and lines that you draw mean, and see
if you don't get an understanding of what points on a Smith chart mean.
You will need to find a text book or authoritive web article to walk you
through the process... but if you don't plot points for yourself on a
blank chart, you probably won't learn the principles.

The case you are talking about of the Z of an o/c stub at a range of
frequencies is an easy one to solve with a Smith chart. You plot the Z at
the load end of the stub, you draw the arcs for constant VSWR for each of
the frequencies of interest (the arcs are of different length for each
frequency because they are plotted in electrical length), and you read
off the source end Z.

That describes the mechanics of solving that problem, but it helps to
understand that the points on a Smith chart are the sum of two phasors on
a complex plane, and what they represent. You don't really understand the
Smith chart unless you understand what happens on a transmission line.

Art,

You seem to have misunderstood my point.

AAALLLLLL antennas, regardless of structure, material, efficiency,
resonance, location, or phase of the moon are Gaussian. Gauss' Law is an
integral part of classical electromagnetics. Nothing can escape.

No, I do not have an engineering degree, but I do have several degrees in physics. Unfortunately, I am significantly dumber than a rock, so I have no more to offer in this thread.

It is accurate for lossless lines. Actual coax
values will tend to spiral in to a Z0 limit.
200 feet of open-circuit RG-58 used on 440 MHz
gets pretty close to 50 ohms after hundreds of
spirals.

The idea is that I want to receive AM and shortwave broadcasts
probably using one antenna. Then, I need to be able to receive 144 mhz
and 440mhz in any direction including straight up for satellites, I am
talking about FM here plus the aviation band in AM. I also want to
receive some frequencies around 800mhz also omnidirectional. I will be
using all of these receive frequencies with an Icom IC-91A. I will
transmit on 144 and 440mhz FM using a Kenwood TM-G707A and a suitable
antenna depending if I want to access a repeater or a satellite. For
that, I have a dual band coaxial type of antenna and I will build
myself a couple of turnstile types for the FM satellites. I just
wanted to minimize the number of antennas I really need.

You don't have to dream, we've discussed many multi resonant arrays.
I've pointed you to a site with 100's of them, and Roy is the author
on the best of them, four squares. It's quite conventional discussion
here actually, but few coming to this group know how to manage the
mutual coupling (something that Gauss wrote about). The many
differences between Roy's writing and yours is that he supplies
accurate design details, complete models, references, coupling
parameters, and characteristics, all that are repeatedly VERIFIED.

There is only one question that remains, really, what is IT that you
are claiming?

Hi Tom,

There are several, some that are way out in the decimals but separable
(Raman scattering). Others like Solitons (a rather old observation)
are used to increase bandwidth in commercial links.

I hesitate to ask what the question is, because all of these effects
require some strain to achieve with very high power densities, often
in the megawatts to gigawatts. If you can find a suitably fast pulse
source, you might do it on a kitchen table. The hardest part of
getting a lot of optical power into a small fiber is overcoming
Numerical Aperture mismatch (sound familiar once you discard the NA?).
Some sources take this in stride (notably semiconductor lasers), while
others (like the sun) are stunningly inefficient.

I had a buddy who built a CO2 UV laser from a Scientific American
Amateur Scientist column. It packed quite a punch for all of five to
ten nanoseconds (capacitor arc discharge from a cap of several hundred
picofarads charged to twenty thousand volts using a very low
inductance lead design). He chose to be careful by aiming it out the
window into the sky. He fired the laser and cracked the window. The
thermal expansion of the glass was sufficiently slow enough to
accumulate enough stress (due to the attenuation) to create a
fracture. Classic thermal runaway.

The design comes from the June, 1974 issue (available from Wes'
introduction of Dr. Shawn here some months ago). The lead paragraph
says it all:
"A RECENTLY DEVELOPED LASER that operates on a six-volt dry
battery emits 10 pulses of ultraviolet radiation per minute, each
pulse about the size and shape of a broomstick. The pulses range
in power from 50 to 100 kilowatts."
...
"The ultraviolet laser can readily be scaled to higher powers. A
discharge path one meter long can develop an output pulse of
almost a million watts, although there is a trick to it."

I will leave the details of that trick to subscribers of Dr. Shawn to
investigate further - if push comes to shove, email me for a copy of

the details.

One thought occurred, this device (augmented to one meter length)
could suitably test the illusion of the anti-glare coating hypothesis.
Free suntan lotion will be supplied to those who rely on faith and
half baked mathematics to prove all reflections are canceled. :-O

Hi Wes,

Thanx again for introducing Dr. Shawn here. I had been looking for a
complete collection of Scientific American construction articles for a
very long time.

My first question would be: is the 8407 calibrated correctly?

When you apply a 50ohm load do you get close to a single spot in the centre of the screen, and when you apply your calibrated Open & Shorts do you get close to single points on the X axis on the outer ring of the Smith Chart? If not then you need to re-calibrate your test set up.

It is a long time since I used an HP8407, but I do recall that they were a pain to calibrate correctly, lacking the auto calibration routines of modern VNA's.

1767. Is Dominator/Predetor(~6dB gain) competent to CP antennas for LPFM?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-24 12:30:51 UTC
From: BK <bhuvankjha@gmail.com>
Message-ID: <1172320251.323049.300030@p10g2000cwp.googlegroups.com>
Source record: 45431

Dear All,
I have been researching for a long time to know weather there is a cost effective alternative to the costly CP antenna bay for my low budget LPFM station. And interestingly I have found the one called Dominator/Predetor (with true ~6dB gain).

1. Norwalk Electronics' Dominator® FM broadcast antenna (http://fmbroadcastantenna.com/)

2. HIGH GAIN COLINEAR ALUMINUM Wave PREDATOR (http://www.pcs-electronics.com/wave-predator-antenna-p-1096.html)

At a the budget of $300 the best high gain antenna I could find are these. And so I have decided to purchase any one of these two. Though
I am still in doubt weather the high gain (nearly 6db not 6dBi) is a hype.

I am looking for some comment on it if some of you have come accross these antennas.

Regards,
Bhuvan

Thanks for the additional information, Mike. For receiving MW and HF broadcast stations, a random length of wire often suffices because these stations tend to employ high power and directional antennas. You might find that by making all or a portion of the antenna vertical, your reception of distant stations is improved. An inverted L antenna is favored by many SWLs. A google search on "SWL antenna" will provide you with a lot of useful information on what others have used successfully. I think a "tuner" or impedance matching circuit will be a useful addition, especially now, at the bottom of the sunspot cycle.

For vhf/uhf omnidirectional reception, your suggestion of a discone should work well, keeping in mind that it may not be suitable for satellite reception in its usual orientation.

What Cushcraft said was that they were discontinuing production of replacement parts for their "older obsolete antennas" including the AP8, AP8A, R4, R5 and R7. This is dated back in the early 2000s sometime so it's pretty old news. I haven't heard or seen anything since that would indicate that they're getting out of the amateur business.

This came up last night while we were putting racks together for a new data center. Someone mentioned that it was theoretically possible to put an infinite amount of information through a fiber because you could have an infinite number of carriers even though the total available frequency response was finite. I declined to argue with him, because he is always right, even when he's not. That reminded me of something I thought you mentioned months ago. You either named the effect, or gave a link to an article about it.

And NA mismatch doesn't ring any bells.

thanks,
tom

YEP!!! Quite active here in NE and along the East of the Mississippi River. It is 1700Z and I'm listening to QSOs on 60-4 and 60-5 from SC and TN. BTW, I'm in NH.

1775. Re: "Noise" antenna for MFJ-1026 "Noise Canceling Signal Enhancer"

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-24 18:01:18 UTC
From: Jan Simons PA0SIM <PA0SIMandnospam@amsat.org>
Message-ID: <1172340083.230085@SLIPstream>
Source record: 45439

Hello Eric,
I guess the MFJ-1026 has the same problem as the MFJ-1025.
The MFJ-1025 does not cover the full 360 degrees fase difference.
So when the MFJ-1026 can not provide the required fase difference,
the noise can not be canceled.
You can make a phaser yourself that outperformes the MFJ-1025:
http://www.pa0sim.nl/Phaser%2080%20-%2010%20meters.htm

It does not matter what kind of noise antenne you use as long as the noise
antenna picks up the same single noise source with abt the same signal
level as the main antenna.

Noise canceling, using two antennas, can only cancel a single noise source.
But it is possible to use eg. two small loop antennas for receive purposes.
The null of the loops can be used to null one noise source and the noise
canceling then can cancel the second noise source.

Digital signal processing makes other tricks possible.
http://www.pa0sim.nl/Digital%20Signal%20Processing%20route.htm
But thats an other story.

73 de Jan PA0SIM

Hi Tom,

His argument fails on the face of it. If something is finite, that
about ends the discussion. Your workmate is confusing his sense of
being unable to encompass a large number with the sense of infinity.

Given there are an infinite number of infinities, you could argue that
perhaps he is talking about one of the smaller, less significant ones.

>That reminded me of something I
>thought you mentioned months ago. You either named the effect, or gave
>a link to an article about it.

It seems that google has changed their search engine and dumbed it
down significantly. I don't recall the discussion except in the most
general terms and searching for it was frustrating. Maybe the thought
will emerge later.

All I can offer that brings us back to 'tronics (and peripherally to
'tennas) is that to fit enough bits into the information content, they
need to be have a certain rise time (very small of course). Rise time
and bandwidth are inextricably related by a factor of about 3. An
infinite amount of information would thus require 3X infinite
bandwidth (see what I mean about infinities?). We encounter the same
limitation in listening to code. When CW is sent at a certain rate,
it defines the receive bandwidth necessary to recover the information.
>And NA mismatch doesn't ring any bells.

As it shouldn't, it is a side topic but relatable to fiber
transmission. I struggled for years trying to get 5 joules of light
energy into a 1mm fiber. I was probably 5% efficient at best and
researching the topic didn't offer the prospects of my expecting much
better. That is why I find impedance matching debates here so amusing
when so much of was just armchair experience.

Hi Harry,

You don't offer enough information. Some resistance is necessary in
the bridge to terminate the sample collected. It is often 50 Ohms,
and just as often it is not. The actual value is a product of the
bridge configuration.

Hi Bhuvan,

Doubt no longer. You can buy the 6dBi for much less from any number
of other vendors. BEWARE of vendors that give their antennas "names."
Product numbers are sufficient for a commodity market. Better yet,
build your own. All antennas can be scaled to ANY frequency.

The single best advice that you could accept is to raise the antenna
as high as you can.

STATICS, I assume you man electrostatics is not a subset of magnetism but in
a lot a lot of ways an analogy can bee drawn between the two. For example
the attractive force betwen to charged particles is inversely proportional
to the square of the distance, this is also true for magnetic particles but
they really have nothing to do with each other.. Art sometimes I think you
are confusing what Gauss wrote about statistics with statics. He did a lot
more work with mathmatics including statistics than he ever did with
magnatism. Your references to Gaussian field further strengthens my belief
since Gausian field refers to a statistical distribution also known as a
Guassian distibution, aka normal distribution.

Hmm, killer question no doubt. A Broadway producer once sagely noted
that if you cannot express your idea on the back of business card, you
don't really have much to offer.

If we are to rummage through the dusty attic of rambling thoughts:
>>Pretty much everybody scorned the idea that antennas could be
>>made better than the yagi because all was known let alone a completely
>>new
>>line of designs which were not made up of parassitic elements let
>>alone of
>>mainly resonant elements in cluster form for choice of polarity.

Would it be galling, Art, for you to be the last to know that Roy has
been publishing Gaussian antennas (not his term, thankfully) for years
and distributed freely with every copy of his modeling software? Would
it be unsettling to realize that Hams have been building them for
decades? Would you be stunned to learn that their theory has been
explained since Marconi was only operating at 5WPM?

Surprised? Consult the Radiotelegraphy chapter of "Standard Handbook
for Electrical Engineers," 1907-1917. Pay attention to the design
called "Bellini-Tosi directive antenna."
"By placing the moving coil in the proper position
signals can be sent in any plane desired."

This was at least 20 years before Yagi and Uda.

An online reference to them 101 years ago:

I do have a homemade short Inverted V for 75M, (24' per leg)
which I pack around.... but as I have stated, most of my parking
situations preclude putting out anything beyond a very short perimeter
around my rig.... necessitating a vertical, (with very short radials at
best). I will try to find that publication, but unless it includes
verticals for 75M / 40M, it probably won't help much in my case. Thanks
anyway!

Harry,

I am not familiar with the specific devices you mention, and you have provided very little info.

I have made and used a device for impedance measurement that basically had a 50 ohm resistor between tx and antenna sockets, and three voltmeters to measure the RF voltage across the antenna, the internal 50 ohm resistor, and the combination. To make a measurement, you apply a small amount of power at the desired frequency and measure the three voltages. From those, you can calculate the antenna impedance, though there is ambiguity about the sign of the antenna reactance.

If you have such a thing, they are for measurment only, you do not leave them inline because of the losses, and of course, they will only withstand very low power.

Do you think you may have such a thing?

> http://www.w5dxp.com/HEDZ.htm

Cecil,

An interesting and practical solution to a 2 band antenna for 80 and 40.

Some constructive comments:

I question to derivation of the name "Half-Extended Double Zepp (HEDZ) Antenna", the length of the radiator of itself has no special properties, no special pattern characteristics. I think you could develop a more descriptive name for the antenna system (because that is what you are describing), brand it even with your callsign to differentiate it.

The first paragraph seems to use the term "antenna" to mean the radiator. The article later talks about "resonance" of the "antenna" and seems to mean a purely resistive load looking into the feedline, so "antenna" here seems to mean dipole + feedline + balun. Perhaps you should refer to dipole + feedline + balun as the "antenna system" to differentiate the two.

Though you discussed the gain of a number of other antennas (are they relevant?), and you show pattern details for 80 and 40 (good), did you discuss the gain and pattern of this antenna on all the other bands that you propose in the last paragraph.

Adding some headings to the layout would help readabilty.

Well done, interesting solution to the challenge of an 80/40 dipole (if one has the space for a 50m long dipole on a suburban block).

Tom,

Perhaps you could explain to him that since he makes the assumption that the width of a carrier (a single frequency) is zero and that therefore an infinite number could fit within a finite bandwidth, he has overlooked the use of more common media (eg phone lines) to carry an "infinite amount of information" by this magical technique.

Don't disabuse him of his concept that a signal of zero bandwidth can carry information at any rate above zero. He might even seek to patent the method!

Such misconceptions are not unusual amongs IT experts who's education started and ended with MS certification.

The bridge is indeed a simple bridge with a single null indicator. It is
for use with less than 1W of RF, and is not intended to be left inline.

Hi Tom,

In unrelated research for a forum I am doing for the Foreign Policy
Association's Global Decisions, I ran across an article that may bear
on your workmate's discussion.

Reference: "The Ultimate White Light," Robert R. Alfano, Scientific
American, Dec. 2006.

The piece is about "supercontinuum light" that exhibits self-phase
modulation when the fiber is forced into nonlinear behavior with
sufficiently high power densities (hence my sidebar discussion in
another posting). The boon here is that this laser replaces 100
parallel lasers (of differing wavelengths) while maintaining coherence
across its spectrum. This increases the data capacity to transmission
rates of petabits. Even compared to today's gigabits, this is still a
very long way from infinite, however.

Since the length is half-way between a Double Zepp and an
Extended Double Zepp, it seems that "Half-Extended" is an
appropriate identifier.

If I didn't talk about the "antenna system", it was an oversight.
I will attempt to edit out any confusion.

As you know, above the EDZ frequency, the pattern becomes multi-
lobbed, sometimes called a "cloverleaf" pattern. Everything above
14 MHz is multi-lobbed with a gain of 10-11 dBi with low TOAs.
I will publish the radiation patterns as time permits.

> Well done, interesting solution to the challenge of an 80/40 dipole (if

Moral: Don't live in suburbia. :-) I just bought a house in Tyler, TX.
I rejected a dozen locations because of not enough room for antennas. I
also educated the Tyler City Council on the Texas/FCC rules for Amateur
Radio Antennas.

Owen. thanks for the link on the BAMA server. It cleared up a lot of
questions.

What threw for the loop was the coupler has to be removed one the
measurement is completed.
I had assumed (and you know what they say about that word) it was like
other couplers and
remained in circuit.

I had not tried either one since obviously the 2 watt resistors were
going to go poof, if used
like its more modern cousins.

I apologize to all for the lack of info and will be more diligent in
the future.

Ed, K7AAT wrote:
"....but as I stated, most of my parking situations preclude putting out anything beyond a short perimeter around my rig.... necessitating a vertical, (with very short radials at best)."

Phil faced the same challenge. Item (1) of his summary says:
"Carry a complete set of mobile whips for lunch stops, or other occasions where you do not have the time or room for anything better."

First on the list in Table 3 is:
"Hustler 75-meter mobile whip mounted vertically on the rear corner of trailer..... S7"

Item (2) says:
"If at all possible, use a 1/4-wave counterpoise clipped tothe trailer when using a mobile whip."

Second on the list in Table 3 is;
"Same as above, with 60-foot counterpoise wire connected to trailer.....S9"

So the counter poise adds about 12 dB to the signal.

A 15-ft high (at the center) 120-ft long dipole is S9+20 dB in Table 3, but surprisingly the loop including the trailer is its equal. The loop is only 30 feet long, or almost the length of the trailer.

That's all I have right now. 75M resonator, and the antenna is mounted on top my rear ladder.... which is well bonded to the chassis frame down below. It works rather well, I believe, but both I and my wife don't want me climbing the ladder for installation/removal, or tuning purposes.

> Item (2) says:
> "If at all possible, use a 1/4-wave counterpoise clipped tothe trailer

Will try that...

>
> Second on the list in Table 3 is;
> "Same as above, with 60-foot counterpoise wire connected to
> trailer.....S9"

I suppose a 60' coil of small wire wouldn't be hard to pack.... will try that too, when space allows. BUT, since I'm mostly on 75/80, whats the difference between the first two, anyway?

>
> So the counter poise adds about 12 dB to the signal.

Well, certainly don't have space for that dipole, and the RV is fibreglass so no easy way to include it in a loop.

Also, though I didn't previously mention, don't want the antenna to be that noticable. A vertical has less visual impact, in my opinion, in that area.

Thanks, Richard.

In fact, I just received a reply to a query for R4, R5 and R7 antenna parts
(storm damage repair) -- said they have them -- and just have to give them
the part numbers from the manual !

Cushcraft (and all commercial antenna mfg.) have been focusing on the
cellular and microwave bands for the past several years.

Thanks Chuck about the inverted L idea, I had never thought about that. What would you recommend for satellite? Turnstile, eggbeater or something else? Thanks again.
Mike.

My concern, too, for the same reason but the readings appear to be authentic. For check, I tried the modified antenna (coax not running through the lower element) on a few other bands with very, very low power and got terrible VSWR readings. I get about a 1.4:1 at the low end of the 10 band, dropping to a 1.1:1 near the top of the band. I believe having big, fat elements helps.

Due to cable loss, my measured VSWR at the transceiver is a skosh better than what I would see at the antenna. A nice chart in the ARRL Antenna Book shows that with 1 dB cable loss (approximate for 100' of RG-8), my 1.4:1 VSWR measured at the radio is actually closer to 1.6 at the antenna. Still a keeper. I went on the air last night with a few watts and got a great signal report from a local ham, so the antenna is working.

A year or two ago I was into playing with various monopole designs for
10 meters and greater freqs.

The bazooka I built and liked was a stainless steel whip for the
radiator. The bazooka sleeve was hook to coax and the mast--at the
sleeve where the bottom of the radiator was mounted on a teflon block
insulator. The sleeve was either 1-1/8 or 1-3/8 copper pipe.

The antenna was fed at the top of the sleeve where the radiator exited,
with a 1:1 current balun on a toroid core. The balun was able to handle
100+ watts and I drove it at 100 W.

The swr was below 1.5:1 on most of the ten meter band, I don't believe it was ever above 2:1, if memory now serves me correct.

The antenna was ok. However, a 1/2 monopole with a gamma feed is what I finally settled on and still run today. Benefit is that this antenna requires a minimal counterpoise for excellent performance and radiation pattern and ease of construction.

Regards,
JS

I need to learn more aboout matching. I picked up the 1989 edition of
ARRL's ANTENNA IMPEDANCE MATCHING at the swap meet a few years ago, but I
really haven't taken the time to dig into it.

I'm starting to think in terms of Smith charts, which I never thought I
would need or use. Surprise!

Thanks for your advice to raise the antenna as high as possible. I can rise a 40 ft of 1 1/2 inch GI pipe on the rooftop of a four story building to achieve 90ft hight for the antenna that shouldn't cost me morethan $300 for the transmission of 100 watt at the transmitter power. I am looking for the high gain antenna as ERP is not mesured rather transmitter power is the concern here for FM transmission.

Carrying a Smith Chart around in your head is a
good way to conceptualize transmission line and
antenna configurations.

1803. tuner - feedline - antenna question ?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-25 15:14:54 UTC
From: dansawyeror <dansawyeror@comcast.net>
Message-ID: <iYGdnQe3abZtOnzYnZ2dnUVZ_u6rnZ2d@comcast.com>
Source record: 45467

All,

I am trying to install a trapped 40m dipole in the attic, the antenna is in place however it is short and resonates at about 7.7 MHz. I decided to try it by using a tuner close to the transmitter in the shack. The feedline is 50 ohm coax. On low power the tuner creates a very low SWR. The transmitter is a solid state 100 watt Heathkit.

However when I transmit according to the SWR Watt meter the system appears to transmit well over 200 watts. It pined the meter on a 200 watt range. I repeated the test twice and then stopped. When it is transmitting the SWR reads about 1.1 to 1. The meter works very well and does not exhibit strange readings on other setups.

My questions are: What is happening? What is causing it?

Thanks - Dan

When the transmitter is putting out 100 watts and the
forward power reading is 200 watts, it means that the
SWR is 5.83:1, i.e. the voltage reflection coefficient
is 0.707 and the power reflection coefficient is 0.5.

To get the power delivered to the load, you must subtract
reflected power from forward power. In your case that seems
to be:
Pfwd - Pref = Pload = ~Psource
200w - 100w = 100w = ~100w

Hi Dan,

The Meter is either not as good as you claim it to be (it doesn't
accurately perform at low power); OR
you have common mode problems (classic).

Do you choke the dipole?

Dan,

I assume in all these scenarios, the VSWR meter is between the
transmitter and ATU, and the ATU is adjusted for low VSWR.

You seem to say raise two issues:
-you have adjusted the tuner for a "very low SWR" on "low power"
(whatever each of those means), and when you transmit at "well over 200
watts" the SWR is 1.1:1; and
- your transmitter rated at 100W indicates "well over 200 watts" into a
1.1:1 load.

Re the first issue: If this is to mean the VSWR is higher on higher
power, the most common reason (but not the only one) that VSWR meters
read better VSWR on very low power is to do with the voltage drop across
the diode(s) in the meter. The scale may be calibrated at higher power
where the diode drop is less significant, perhaps even insignificant, and
when you adjust the meter for maximum sensitivity the diode drop
introduces significant error.

Re the second issue, if the instrument is a typical directional
wattmeter, the power output is calculated by deducting the "reflected
power" from the "forward power", but at VSWR=1.1 the "reflected power is

0.2% of "forward power" and insignificant. Otherwise, it might just have an RF voltmeter sampling the line and calibrated in watts, and which is only valid at very low VSWR. Transmitters don't often exceed their rated power by over 100%, so your reading casts doubt on your meter. It sounds like you need to make another measurement with another instrument to locate the problem.

Dear Bhuvan (no call given):

If the antenna is for a LPFM station licensed by the FCC (U.S.A.), then
tight restrictions exist on the height of the antenna. Where are you
located?

In any case, as Richard has said, one may buy an antenna for the purpose for
less money.

<<two things pop into mind could be your antenna is radiating towards
and into or near your radio and causing some feedback that might effect
the radio and or the meter

there is also the possibility that you have some bad (common mode? etc)
current flowing back down the coax which could also wreck havock

just my guess and double check the above and grounds

put a dummy load into your tuner see if you get proper readings

I hope the fence is non-metal.

How about some bamboo/fiberglass/pvc "stand offs" to lift the antenna
free and clear of the gate and anything entering/exiting--higher the
better.

.....
If the antenna is for a LPFM station licensed by the FCC (U.S.A.),
then
tight restrictions exist on the height of the antenna.

Where are you located?
.....
I know the LPFM policy of FCC, that stick to ERP. But I am located in Nepal. Upon inquary to the communication ministry, the engineer there stated that they would be concerned with PEP. I can feel the concerened engineer is either having little or excessive knowledge of FM transmission. What I have seen here is that they would measure the transmission of a station as 100 Watt at the transmitter power in my case. So, often stations are built with a stacked array of broadband antennas. But I can't afford that antenna system though trying to have a cost effective antenna system to boost the ERP of my station operating at 100 Watt @ transmitter power.

Regards,
Bhuvan

1815. Issue with antenna causing instabillity

Newsgroup: rec.radio.amateur.antenna
Date: 2007-02-26 06:11:17 UTC
From: David <dhuisman@bigpond.net.au>
Message-ID: <9SuEh.3761$8U4.3204@news-server.bigpond.net.au>
Source record: 45479

I have just completed the design of a 151 MHz ASK transceiver.

On the bench the unit works fine with sensitivity to around -115 dBm
however, when I attach an antenna, the RSSI level increases dramatically
and it appears something may have become unstable.

I have tried a commercial ground independent antenna and a 1/4 wave whip
and the results are the same.

If I disconnect the antenna and leave the RF input floating, it behaves
properly. I can also attach a small wire (say 300mm) directly to the RF
input and it also works fine. It just plays up when I have a proper
antenna connected.

I am not sure if this may be some issue with the VSWR of the antenna
causing some instability (I tried a 3dB pad between RF input and antenna
and this did not fix the problem), or whether the input is so sensitive
that it is picking up the LO from the radio and causing regeneration ?

A Spectrum Analyser was used to determine if anything else is being
transmitted in that region and it appears to be clear to well outside
the bandwidth of my receiver.

Any ideas much appreciated for what might be happening or methods of
debugging my design.
(The circuit consists of an RF switch after the Antenna port (selects
TX/RX) then into a 50 Ohm RF Amp, followed by a tuned circuit into an
SA6505 RF IF. The LO is crystal based harmonic Butler emitter follower.

PS. I also tried bypassing the RF Amp but still no improvement.

Thanks in advance

Regards

David

David,

There are a number of things that might make the amplifier perform differently if the source impedance changes, and you seem to be exploring those.

Another thought:

One of the things that a real antenna introduces to the mix (cf a signal generator) is the real world RF environment with a host of signals to mix with each other in your receiver.

A quick check for this is to see if the S/N ratio of a weak signal is improved by inserting an attenuator after the antenna. Obviously, inserting a large amount of attenuation will degrade S/N, but try 6, 10, 15dB.

You have described the selectivity of the front end as "and then a tuned circuit". Front end selectivity is very important in preventing loss of receiver sensitivity by noise from IMD in the rx front end.

Owen,

Thanks for the prompt response. I'll try a step attenuator in line with
the antenna and different values of attenuation to see how these effect
noise level.

Since my post I also tried placing the receiver in a metal enclosure in
case it was picking up and regenerating the LO but this had no effect.

A simple piece of wire soldered to the antenna pads works a treat. I
don't have a variable mismatch available to see how stable the input is
for different VSWR.

Would I get an indication by soldering various values of resistance
across the antenna pads and see if the system becomes unstable again ?

Regards

David

Source record: 45482

I have done some more investigation and found that the input filtering
is very broad (more of a match and a filter).

I am getting quite large responses at the image frequency and a couple
of smaller but still significant responses around 145-147 MHz.

The operating frequency is 151.637 MHz but these other responses are
causing a combined rise in RSSI.

I want to be able to test the design as it is before committing to a new
PCB. Can I simply retrofit a filter in line with the antenna (The unit
transmits also but only at 20dBm).

If this is an option, do you have any suggestions for a basic circuit
that will give good attenuation below say 150 MHz.(Steep cutoff)

Thanks again

Regards

David

How can that be? If the meter is basically a directional coupler then the forward power is just that. Subtracting any reflected power will just give a stupid answer. The only errors will be due to the directivity of the coupler, which will give a band of uncertainty which varies with VSWR, and the error due to the accuracy of the detectors.

My Bird does not subtract any reflected power to give a forward power reading!! It can't I need to rotate the slug to read reverse power.

David <dhuisman@bigpond.net.au> wrote in
news:eIwEh.3806$8U4.3629@news-server.bigpond.net.au:

David,

You could try to get your hands on a tuneable bandpass filter, eg a coaxial filter can as used in repeater installations, and place it inline. If it fixes the problem, it points to IMD, and the need to design a sufficiently good filter, but not necessarily as good as the can.

Image response only doubles the ambient noise, unless you are actually hearing image signals above ambient noise levels. The lack of image rejection points to a lack of front end selectivity, but IMD noise is another mechanism that creates in band noise (and image noise) from undesired signals in the environment.

Did you do the test to see if a small amount of attenuation improves S/N, it should degrade it, but attenuation reduces IM products by more than the attenuation (two or more times, depending on the mixing process).

I suggest you need a bandpass filter, what makes you think that IM products are only below the operating frequency?

Jeff, without commenting on whether Cecil's assertions are right or wrong, you seem to have some misconceptions about what is measured with your Bird (presumably 43).

The so called "forward power" and "reflected power" are notional values, but not actual power "components". The only power is the average rate at which energy passes a point, and it is in one direction or the other.

In fact the power can be calculated taking "forward power" minus "reflected power", but only in the case where the sampler is calibrated for Zo being real (as it is in a Bird 43).

My article at http://www.vk1od.net/VSWR/VSWRMeter.htm describes the operation of a Bruene type of VSWR meter and discusses the power measurement issue. Though the sampler in the Bird is different to the Bruene sampler, the Bird samples V and I in a very small region (regarded a point) and sums them in the same way as the Bruene circuit.

Have you tried putting a straight 50-ohm dummy load on it? If that causes the instability, then you need to look at the first device the signal encounters to see if it's stable in that configuration.

Otherwise, I'd look to strong nearby signals. The step attenuator should help with that. If introducing 6db of attenuation reduces the problem by

18db or so, then you have intermod problems (3rd order).

I am sorry, but I disagree, forward power is real and can be measured, or if you wish separated out with a circulator or isolator. What you are describing could be called 'transmitted' power or power delivered into a mismatched load, but that it different from forward power, or the power delivered by the source.

Depends if the meter is before or after the tuner. If the meter is after
the tuner, then the tuner is taking reflected power and adding it to the
transmitter's contribution.

> My Bird does not subtract any reflected power to give a forward power
> reading!! It can't I need to rotate the slug to read reverse power.

If you put your bird AFTER a tuner on a line that's near 6-to-1, it will
also show twice as much power as the transmitter is putting into the
tuner. Or a bit less if the tuner is not efficient.

Hello,

I am building the cable to hook up the 706MKIIG to the SG-237 smart tuner
SGC's instructions for the 230 say to use a 1000uf Cap + a 91k resistor is
this required for the SG-237 unit? or just the SG-230?

SGC's Documentation Below!

One of the BEST POSSIBLE grounds uses rebar in buried concrete;
Google for "ufer ground" and read to your heart's content.

When I had a basement built beneath my house, I installed a Ufer
ground in the footing around about half of its perimeter.

Subtracting any reflected power will give the power
being delivered to the load. Power reflected from
the load is power that is NOT delivered to the load.

> The only errors will be due to the directivity of the
> coupler, which will give a band of uncertainty which varies with VSWR, and
> the error due to the accuracy of the detectors.

Consider the following example assuming a lossless
tuner and transmission line.

100W source+tuner--x--50 ohm coax-----291.42 ohm load

Assuming the tuner is properly tuned, what forward power
will a Bird read on the 50 ohm coax at point 'x'? What
reflected power? What is the net power being delivered
to the load?

> My Bird does not subtract any reflected power to give a forward power
> reading!! It can't I need to rotate the slug to read reverse power.

You're right. The operator must measure the forward power
and the reflected power and do the subtraction manually.
In the above example, the Bird will read 200w forward and
100w reflected. The operator must subtract those two values
to determine the net power delivered to the load.

This was my guess as to why the Bird was reading 200w in
the original posting. Note that a Bird between the source
and the tuner does NOT read the SWR on the transmission
line between the tuner and the load.

Dan, are you measuring that power on the input or
output of the tuner? If at the output of a transceiver
with autotuner, for instance, the forward power is
the sum of the transmitter power and reflected power.

Because ERP (or EIRP, depending on the application) is how most licensing works, because that's what's important for spectrum management in a shared band. Ham radio is somewhat unique in that the rules are applied on power somewhere in the middle of the system (i.e. in the feedline from Tx to antenna), with no limits (except for RF safety) on the radiated field strength. If you can build a 60dBi antenna and radiate 1.5 GW EIRP, you can do it. (part of that 'encouraging experimentation and advances in the radio art').

yes, commercial broadcast is regulated in terms of power output, but, since you have to do a "proof of performance" and demonstrate that you have a certain field strength at a distance, it's really regulating ERP. Change your antenna gain, and they can conceivably make you change your Tx power.

> but not actual power "components". The only power is the average rate at
> which energy passes a point, and it is in one direction or the other.

That statement depends upon the definition of "power"
being used. The IEEE Dictionary has a different
definition of power than does a physics textbook.
The net power is the average rate at which net energy
passes a point. The net power is the difference between
the forward joules/sec and the reflected joules/sec.

Instead of using the word "power", let's switch over to
the dimensions of power, i.e. "joules/second". Those
joules are indeed *actual energy components*.

The so called "forward power" is a forward traveling
EM wave containing energy moving at the speed of light.
There are indeed actual forward joules/sec moving past
a point on the transmission line.

The so called "reflected power" is a rearward traveling
EM wave containing energy moving at the speed of light.
There are indeed actual reflected joules/sec moving past
a point on the transmission line.

Note that an EM wave cannot stand still. According
to the theory of relativity, EM waves always move at
the speed of light (taking VF into account).

Standing waves consist of a forward traveling wave
containing joules/second and a reflected traveling
wave containing joules/second. The joules/second in
those two waves are supplied during the transient
power-on state. During steady-state, that energy has
not yet reached the load. But the total energy contained
in the transmission line during steady-state is exactly
the amount of energy needed to support the forward
traveling wave and the reflected traveling wave. Standing
waves would not be possible without those two real EM
wave energy components traveling in opposite directions.

At power-down, assuming the source is disconnected
from the transmission line, all of the forward wave
energy and reflected wave energy stored in the lossless
transmission line is eventually dissipated in the load.

That happens during a time when the source is supplying
zero energy.

Hi Dan,

One very simple test is to fire up your rig and note the SWR. Patch in a short, loose length of transmission line to the existing run (about an eighth wave) and fire up the rig again.

Did the SWR change?

If so, you are being SWR whipped by Common Mode currents.

You can keep introducing different lengths of line until you find 1:1 (unlikely, but perhaps close) and let it go at that. This will be a single frequency solution, but take care that it does NOT cure Common Modality. Instead, it adds a vertical component to your transmission (maybe).

This is not always good as that same transmission line (plus extension) may run past RF sensitive devices (like intercoms, VCRs, light dimmers, etc.) that go whacko. It may also fill in the nulls of your dipole (sometimes good, sometimes bad).

Hi Jeff,

Your appologies aside, it is the convention you are disagreeing with.
The injection of such terminology as
>'transmitted' power
is not part of conventional usage in this discussion. The trap here
of inventing terms is that your term would not account for Ohmic loss
as either forward or reverse power in the balance sheet (and this loss
could well be the source of mismatch); and yet this loss would have a
definite impact on what is "transmitted."

A simple instance proves this. Add a 14 Ohm resistor in series at the
feed to a perfect quarterwave radiator. The reverse reading would be
nada, the forward reading would NOT be "transmitted" power. Further,
the conventional usage of terms seen in this thread would still be
accurate.

A 100 foot dipole will work great on the broadcast band, and for receiving,
will be usable up to around 30 MHz. You will need at least 1 other antenna.
A 20 - 1000 MHz discone won't work very well, compared to a beam cut for a
particular frequency, but is probably the simplest way to go.

Jeff,

You dropped a number of terms here:
- 'transmitted' power;
- power delivered into a mismatched load;
- forward power;
- power delivered by the source;

The power delivered to a load (of any kind) from a lossless transmission line section, is the same as the power delivered by the source. In the case of the lossy line, then the line characteristics and load impedance also need to be taken into account to calculate the power lost in the line section, and it is not as simple as using up a dB/100' rating in a table (unless the line is matched).

You assertion that you have travelling forward and reflected power waves on the transmission line runs into a problem when you try to analyse the combination of both at a point (eg the input to the line) as power doesn't combine vectorially.

When you devise configurations with circulators, isolaters, directional couplers, hybrids etc to "trap and reroute" reflected power, you have probably changed the nature of the load on a line section and that accounts for why the reflected power seems to have been isolated from forward power.

John-

I don't think they are in production any longer. Look for a Telex
Hy-Gain model 18TD Tape Doublet or a Hy-Gain model H-4000 Portable Reel
Tape Doublet Antenna. I think there was also a Mil-Spec version.

These antennas have a scale in meters on each tape, and came with a
meter to frequency conversion chart. The instructions claim a frequency
range of 3.5 to 30 MHz. You could adjust the elements to VHF lengths,
but the wound-up tape may interfere with the antenna's operation.

So it is your contention that power is not reflected at a mismatch. The wave certainly is so the power contained in the reflected portion must be as well.

I was not trying to analyse the combination of any wave on the line ("power" waves, whatever they may be, or anything else), I was merely noting that you can quantify and measure the power contained the both the forward and reflected waves and they are real quantities.

But it does combine according to the following formula
which is the irradiance equation from the field of
optics.

Ptot = P1 + P2 + 2*SQRT(P1*P2)cos(A)

where 'A' is the angle between V1 and V2 and V1 is
the voltage associated with P1 and V2 is the voltage
associated with P2.

The first time I saw this equation was in Dr. Best's
Nov/Dec 2001 QEX article on Transmissions Lines. It
really does work for "adding" the two powers in two
coherent waves.

The joules/sec are real quantities but whether joules/sec
is power depends upon the definition of "power". Some say
the joules/sec in a reflected wave is not power and they
produce a definition of "power" from a physics book to
prove it, i.e. no work done. To satisfy the purists you
may need to change your statement to: "I was merely noting
that you can quantify and measure the joules/sec contained

Cecil,

A is not a property of P1 or P2, and cannot be derived from them. I
maintain that you cannot vectorially combine P1 and P2.

The danger in the "power is refelected at a mismatch" explanation, is
that it follows that power reflected at a mismatched antenna flows back
toward the transmitter and is at least partially absorbed in the PA as
heat. Though that is a popular belief, it is not supported by fact.

The power at a point in a transmission line is P=real(V*conjugate(I)).
This expands to four terms, and people arbitrarily allocate the terms
forward power and reflected power to just two of the four terms because
they happen to be VfIf and VrIr.

>
>> You assertion that you have travelling forward and reflected power

The Bird 43 does not measure power directly, it responds to Vf or Vr
components at a point as explained in the article I quoted. The article
deals with the conditions under which readings can be converted to power,
and whether forward power or reverse power are of themselves meaninful.

If you have read it and disagree, then thats ok. If you can identify
flaws in the article, constructive feedback is welcome.

I had a similar problem once. The RX would pick up everything form DC to
daylight, lots of interference from local broadcast AM stations. Problem was
a shorted bypass cap in he second stage of the RF amp. This stage was
suppose to be operating at near unity but with the shorted cap it was
operating at near 20db overloading the rx and sometimes breaking into

oscilation. Also check the output of the LO for harmonic content. Harmonics. may not seem to be a noticable problem when the rx is connected to a signal generator but could be a major issue when the radio is connected to an antenna.

P1 is a property of V1^2/Z0, A is a property of V1.
P2 is a property of V2^2/Z0, A is a property of V2.
There is an unbroken chain of cause and effect.
It is true that one cannot directly vectorially
combine P1 and P2 because P1 and P2 are not vectors.

However, the ability to combine the P1 and P2 of
coherent EM waves dates back to before you were born.
Optical engineers didn't have the luxury of being
able to measure the phase angles. All they could
measure was the total amplitude. Please don't try
to tell us that their total amplitude measurements
were wrong throughout the 20th century and are
still wrong in the 21st century.

The rules for combining P1 and P2 when they are
coherent are known as the irradiance equations in
optics. Dr. Best applied them to RF quantities.
Please reference "Optics", by Hecht, 4th edition,
page 388 and Dr. Best's, "Wave Mechanics of Transmission
Lines, Part 3: ..." in the Nov/Dec 2001 issue of "QEX".

That only applies to mismatched systems. For systems
Z0-matched by an antenna tuner, the situation becomes
trivial to understand. The reflected energy is re-
reflected by the Z0-match provided by the properly
tuned antenna tuner. It's all explained in my energy
analysis article at: http://www.w5dxp.com/energy.htm

That doesn't mean that there are not valid rules for
combining P1 and P2. Optical engineers have been doing
it for decades. RF engineers seem to lag behind.

You seemed to be questioning the validity of the power
combination equation. Have you changed your mind?

Cecil, it seems that between the two of you, you are constructing a picture that (in a lossless line for simplicity) if the Bird 43 reads 100W forward and 50 watts reflected, the power radiated (ignoring antenna ohmic losses) is 100W, but 50W is reflected toward the transmitter... but that's allright because the 50W will be reflected by a Zo matched PA, and energy is conserved on the line.

The reality is that the Bird responds to Vf and Vr (depending on the orientation of the slug), and in the special case where the sampler is calibrated to respond to |Vf| and |Vr| for a purely real ratio of V/I (Zn=Rn+j0 which is 50+j0 in the case of the '43), on the line at the point of the sampler, then the average power passing that point is a single number, it is |Vf|^2/Rn-|Vr|^2/Rn. The foward and reflected power readings are not meaningful in themselves, but you can deconstruct rho, and (knowing Zn) |Vf| and |Vr| from them.

Please don't insult our intelligence. If the Bird reads
100w forward and 50w reflected, the power radiated by
the antenna is 50w, neglecting losses.

Pload = Pfor - Pref

The situation at the output of a lossless tuner is:

Pfor = Psource + Pref

Please honor the conservation of energy principle in your
postings.

>
> Please don't insult our intelligence. If the Bird reads

Of course it is nonsense, but it is a logical development based on Jeff's
words "What you are describing could be called 'transmitted' power or
power delivered into a mismatched load, but that it different from
forward power, or the power delivered by the source" and your words "For
systems
Z0-matched by an antenna tuner, the situation becomes trivial to
understand. The reflected energy is re-reflected by the Z0-match provided
by the properly tuned antenna tuner".

The steady state solution of the ratio of V/I at the input to a real
transmission line section (ie lossy) that has a load of some arbitrary
impedance is solved using equations that do not include forward and
reflected power terms. The power at any point is the real part of
V*conjugate(I) at that point, no matter whether it is at the source,
load, line input, output or anywhere along the line.

Please don't blame me for someone else's words.

The irradiance (power) equations from optical engineering
for the combining of electromagnetic power from two EM waves
are accepted as a fact of physics. Do you really think that
the amateur radio community should reject that fact
of physics?

Do you mean the experience that the PA may (but not necessarily) run
hotter on other than its rated load impedance?

Could that be exlained without introducing transmission lines and the
reflected power issue by examining how the PA works on a load different
to its rated load?

I suggest that if a PA / line / load situation transforms the actual load
to some arbitrary impedance Z at the PA end of the line, the PA will
peform exactly as if the PA were directly loaded by a lumped constant
load of Z. The explanation of any heating effects or changed operating
voltages is in the effect of the load impedance Z (however it is
obtained) on the PA.

Does that make sense?

Owen

Yes, that is true for the performance of the PA.
Certainly not true for the performance of the
transmission line or antenna.

My favorite quotation by an antenna guru on this
newsgroup is that "a 50 ohm antenna can be replaced
by a 50 ohm resistor without changing anything".
If that were true, we don't need antennas. :-)

I'm going to be away from my computer for 48 hours.

Richard, I content that:
- the power output of the PA; and
- the efficiency of the PA may be (and usually are) sensitive to the load impedance.

A steady state analysis is usually adequate for most ham radio applications, though there may be cases where establishment of steady state brings its own issues. This discussion is about the steady state.

Though it is often asserted that the PA will get hotter as a result of "reflected power" being dissipated in the dynamic output impedance of the PA, and that this may / will damage the PA, the power explanation doesn't work numerically in the general case.

The constrained ratio of V/I is an aspect of the field setup in a transmission line, and the launching of a reflected wave to reconcile the load V/I with the constrained (Vf+Vr)/If-Ir) at the load end of the line is a solution for what happens on the transmission line. At the source end of the line, (Vf+Vr)/If-Ir) at that point (a function of (Vf+Vr)/If-Ir at the load end, and the complex propagation coefficient and Zo of the line) give us the equivalent (complex) impedance seen by the PA, and we can predict / explain the behaviour of the PA (maximum power out, efficiency) on that equivalent load. This method of analysis does work numerically.

Yes. I have seen a lot of Smith charts for broadband Navy shipboard antennas. The people who match them obviously have to do a chart for the raw antenna in place on the ship, then design and adjust a matching network, followed by a chart of the results, with every point inside the 3:1 (or 4:1) circle. Their efforts are generally documented in the ships' antenna files.

I agree about the Smith chart for conceptualizing but at this stage, I am just a Smith baby.

Back on topic, I am using the sleeve in a conventional dipole configuration until I can take the time to apply the ideas presented in this NG. I noticed this afternoon that coiling four turns of decoupling loop a few feet from the feed actually raised the VSWR, which I didn't understand. Also, where the coax hangs down next to the antenna makes a difference in the VSWR, so obviously the line is not "flat" and is instead part of the antenna. (Do we still use the term "flat" to describe a transmission line which is properly matched to the load? I recall it from Navy training more than 40 years ago.) My first HF antenna works, but it's clearly no marvel.

Yes, I think that the meaning taken for a "flat line" is one with 1:1 or
close VSWR, flat to mean the magnitude of the voltage (or current) is
approximately constant all all positions on the line, and that describes
only what is happening on the inside of the line. That doesn't preclude
current flowing on the outside of the line which seems to be your issue.
I won't confuse you with examples of where the outside of the line is
intended to carry current and at the same time the VSWR is low, but it is
possible and sometimes desired.

I agree with you that if you change the feedline routing physically, and you see a consequent change in VSWR, that suggests the outside of the feedline carries current and is part of the radiating system, and I don't think that is what you want.

> My first HF antenna works, but it's clearly no marvel.

Look upon it as an opportunity for learning. After all, what would you do if it just worked?

Thanks for the link. Interesting but a little bit advanced for me.

I talked with an RF engineer who worked for Collins radio who suggested just using a JFET buffer between the antenna rod and the mixer input so the impedance matching problem would go away, and I would get much more signal since the antenna rod will see an open circuit (no load) and have maximum Q.

He was right, and I was able to get about 18dB more signal from the antenna rod without using any additional windings. But I had to add a JFET, resistor, and two caps.

Head off to another band, perhaps? Make more and start passing them out?
But you're right, of course. I still have three or four suggestions to try
for the sleeve.

I just read your first posting. It sounds like you are building what I refer to as a coaxial dipole. The key to success with coaxial dipoles is decoupling the feedline. A common configuration is to place a set of radials, or a quarter wave choke to be effective a quarter wave below the bottom of the dipole lower element... this actually attempts to reduce current below the radials, and uses the quarter wave of feedline above the radials as part of the radiator for a little more gain.

IIRC, the ARRL had some suggestions about decoupling a coaxial dipole.

Sal:

I thought it might be clear from my previous post, but I see it was
rather "cryptic."

I DID find that the coax wanted to couple into the antenna and become
part of it (the sleeve itself was NOT a sufficient de-coupling device.)
I found the 1:1 current balun was absolutely necessary to make the
antenna "stable"--remove the sensitivity to
location/orientation/length/etc. of the coax feed.

This is not contending nor contention and is content only for a non
sequitur. The line following a tuner exhibits considerable loss (poor
efficiency) that can only occur on the basis of power and mismatch.
You yourself offered in other correspondence that it exceeds cable
attenuation specifications found only in a matching condition. To
suggest that a PA's sensitivity is somehow exhalted in the face of
identical, ordinary behavior of a passive component is hardly
seperable. Consider the simple substitution to your quote:
>- the power output at the terminus of the line; and
>- the efficiency at the terminus of the line may be (and usually are) sensitive to the
load
>impedance.

continuing on...
>A steady state analysis is usually adequate for most ham radio

>PA, and that this may / will damage the PA, the power explanation doesn't
>work numerically in the general case.

Heat is the outward proof of power and is always demonstrable in both
specific and general cases. Occurrences of other, significant
radiation from the source (as long as that source physically occupies
a substantially minor region of wavelength) is exceedingly difficult
to achieve.

You don't offer a numerical proof of a general case, and given that the general case must allow for the specific cases already allowed in your discussion above - that may be an untenable assertion for you. Those specific cases are demonstrably caloric and must follow the same math you suggest.

I suspect you are trying to argue differences by degree (no pun intended as to heat); but I seriously doubt you can produce the math to do that. The arguments that flow from that involve what is called source resistance, and those arguments are legion in this forum (where naysayers embrace a refusal to accept or name ANY value - a curious paradox and an engineering nihilism I enjoy to watch).

Only a logical development if you selectively snip Owen.

"What you are describing could be called 'transmitted' power or
power delivered into a mismatched load" was referring to "Pload = Pfor -
Pref".

Ok I admit that 'transmitted' power could have been better phrased.

Power may not actually be dissipated in a lossless line but that does not
detract from the fact that there is current flow and a voltage along the
line produced by two distinct and independent waves travelling in opposite
directions. True that the power can only be realised when it encounters a
load, but it is highly pedantic not to regard the reflected signal as having
'power' until it actually encounters such a load. If you extend this theory
to a radiated signal, you could equally say that there is no power
travelling through the aether until it encounters a receiver.

It is naive to believe that reflected power is not dissipated in a matched
source, or partially re-reflected at the source/line interface is not
matched. Again going back to the optics corollary you would not expect a
reflected light signal not to impinge on, and interact with a source.

If you pad out a source with a sufficiently high attenuator such that the
reflected signal will not have significant effect on it, you will see an
increase in dissipation in the attenuators when the load is mis-matched. I
am confident that an attenuator is not having its "load line" changed such
that its dissipation goes up magically just by the same amount as the power
in the reflected wave!! (Of course the dissipation in the load is measurable
as heat).

Adding a circulator to a system will not change "the load line" (if a
transmission line or circulator can have such a thing), but it will cause
the power in the reflected wave to be separated so that it can be monitored
and measured. Surprisingly power monitored in this way ties up with the
notion that power is reflected at a mis-matched load.

That sounds like a direct misquotation of me.

What I HAVE said - and often - is that if you measure the load impedance presented by an antenna and feedline at the output socket of the transmitter, and replace it by the same impedance made from lumped R and L/C components, then the steady-state operating conditions of the transmitter will not change.

If the transmitter isn't touched, it will deliver exactly the same power as before - because that happens to be how much power it can deliver into that particular load impedance.

That's all the RF power there is. In a lossless system, all of that power will be radiated from the antenna. With the alternative lumped load, exactly the same power will be delivered into the resistive part of the load, and dissipated as heat.

Of course the transmitter is under more stress from voltage, current and heat when it's operating into an incorrect load impedance (not what it was designed for) but that's all it is. There is no need to invent reflected power that is being "dumped" back into the transmitter to cause this stress.

There is also a strong tendency to invent virtual instruments such as "directional wattmeters" which do not actually exist. An instrument such as the Bird 43 is calibrated in watts, but it doesn't actually sample power. As Owen relates (and so have I) these instrument only sample V and I on the line - they categorically DO NOT sample power.

The power scale is only a meter calibration - literally, only ink on a meter scale. It indicates the amount of power delivered into a matched load, when the "reverse" reading is exactly zero [1]. The instrument was calibrated under those specific conditions, and the "forward power" reading is only physically meaningful for that specific case.

For a mismatched load, the meter will read higher in the forward direction than in the reverse - but that is purely a feature of the instrument. It all looks so plausible on the meter scale, but those are not genuine power waves flowing in opposite directions.

Everything that's happening inside the instrument can be completely explained from the new V and I conditions on the line. Waves of power simply don't come into it. Most people don't want to go that deep into the theory... but, regrettably, that may be the only way to understand that the "power" readings on the meter scale are no longer valid under these conditions.

What IS physically meaningful is the DIFFERENCE between the forward and reverse "power" readings. That difference will equal the net power delivered to the load [1]. But those two readings are only meaningful as a pair - individually they are only "intermediate results" with no physical meaning of their own.

[1] Ignoring real-life meter errors such as directivity and scale accuracy.

If the transmission line and antenna are replaced by a lumped constant
load, the transmission line and antenna cease to function. IMO, that's
not "performing exactly as".

Hi Ian,

We've been through this before. No instrument operates in the absence of power. Simply because you and Owen are graced with instruments that demand so little, does not negate what power they do rob from what is available. Even the humble electrometer has to overcome the force of gravity to open its foil leaves, and climbing that potential energy hill is work over time - power.

Hammer down the directivity as much as you want, and it will still resolve to some diminution of power available to the load. To wave a hand and say NOTHING does not make it so.

Nope, it wasn't you, Ian. You are usually more careful than that.

> For a mismatched load, the meter will read higher in the forward

But they are genuine energy waves flowing in opposite directions.
Standing waves require two coherent energy waves flowing in opposite
directions. Can you explain how to create a standing wave without
two energy waves flowing in opposite directions? And remember, the
two EM wave components in the standing wave cannot stand still.

There's truth in what you say, Ian, but it is not the whole truth.
There's
no difference except frequency (and all that frequency implies)
between
an RF electromagnetic wave and a visible light electromagnetic wave.
In fact, RF waves are covered in many physics textbooks whose subject
is light. There is a wealth of information available from the field of
optics
that is applicable to RF waves.

Visible light physicists don't have the luxury of measuring voltage or
directly measuring phase. They have to rely on a power measurement
of irradiance. As a result, visible light measurements are actually
power measurements so we indeed do know how EM waves behave
at the joules/second level.

Visible light physicists found that when they superpose two coherent
light waves, Ptotal = P1 + P2 + 2*SQRT(P1*P2)cos(A)
where 'A' is the angle between the electric fields of the two waves.
That exact same equation applies to coherent RF waves. Phasor
addition is used for the superposition of two coherent RF voltages.
The power equation is used to find out what happens to the power
during that voltage superposition. P1 = V1^2*Z0 and P2 = V2^2*Z0
The last term in the power equation is known as the interference term

and is either constructive, destructive, or zero.

Since antenna radiation patterns depend upon constructive and
destructive interference of EM waves in space, we hams could
learn a lot from the field of physics known as optics.

Yes, and a little modulation added to the source signal will prove
that the
signal being dissipated by the circulator resistor has made a round
trip
to the load and back. That's hard to explain if reflected energy
doesn't
actually exist.

Richard, that argument is otiose.

What I said (in full context) was that their principle of operation as measuring instruments does not involve sampling traveling waves of power from the line.

Of course they must incidentally consume some power to move the meter needle, but that is not part of their operating principle.

For that matter, almost all measuring instruments abstract some energy or power from whatever they are measuring - but that is usually incidental. It certainly does not make every instrument into a power meter.

Can you not see this?

>To wave a
>hand and say NOTHING does not make it so.

To wave another hand and say traveling waves of power exist does not make that so, either.

no need to be surprised at having an antenna with elements that are
all phased. I doubt if ther is anyone on the news group that doesnt
know that a Yagi Uda antenna doesnt represent some kind of comprimise
to an antenna with all of the elements feed. No one has ever said
otherwise although you have claimed they have.
The problem with having all the elements feed is that it is
impractical to control power distribution and phasing when changing
frequencies. The Yagi Uda overcomes this problem at a slight cost in
gain. Your idea of an antenna with multiple fed resonant elements is a
giant step backwards to a day when high gain steerable antennas were
impractical most of the hams who didnt have the money or the real
estate for huge arrays

Antenna with multiple resonant element all being fed is very common in
RADAR and space communication, you can achive very high gains in this
manner just as you have stated. It is also very expensive, has narrow
bandwidth and is a mechanical nightmare. NASA, AM BCB, commercial
shortwave stations and various other agencies and private companies
sometimes have a need for this type of antenna and they they have the
money to build them, few hams do. The Yagi Uda antenna just fills a

practical niche in antenna requirements. No ham I know of ever thought the Yagi antenna was the end-all of antennas as you have claimed. While it may not have the highest gain it certainly is the most practical antenna for a lot of us.

I am being picky, but "it *may* exceed cable attenuation specifications
found only in a matching condition, it may also be lower". If I said it
as you stated, I made an error. The common statement (and I have no doubt
made it) that VSWR exacerbates line loss is actually wrong in the general
case. (Having Googled my own web site I see one statement along those
lines which needs further qualification!)

PAs can be designed to behave as an equivalent fixed voltage or current source with fixed source impedance of Zo, but HF PAs are not usually designed in that way.

I know that there is a vein of thought that the process of adjusting a PA for maximum output always, somewhat magically, creates a match condition where the source impedance is the conjugate of the load at the PA terminals, but it is contentious. What of broadband PA designs with no such adjustment, are they source matched over a broad range of frequencies? Observations are that experiments to discover the source impedance by incrementally changing load current can produce a range of values for the same PA on different frequencies, and at different power levels. Why do amplifiers with say tetrodes and triodes which exhibit such different dynamic plate resistance but requiring the same load impedance deliver the same equivalent source impedance?

I am also aware that supporters of the inherent source match position assert that you must be selective in choosing tests for source impedance. It is all rather unconvincing when only some of the implications of a particular source impedance are effective.

It is my view that modelling the PA as a fixed voltage or current source with fixed source impedance of Zo, and where reflected waves on a transmission line are absorbed by the matched source is not a good general model for HF PAs.

The application of small signal analysis to amplifiers that sweep from near cutoff to near saturation is suspect.

I believe that it is sound (in the steady state) to resolve the forward and reflected wave voltages and currents at the source end of the transmission line, calculate the complex impedance, and predict the effects of that impedance as a PA load using the same techniques that were used to design the PA.

Hi Ian,

As a trained metrologist, I've seen it far closer up than you. I've accurately measured the physics of technology out to more decimal places than most, and there is nothing incidental about it - it is quite fundamental. In fact I've encountered a spectrum of conflicting and interfering physical principles to every measurement that had to be accounted for to obtain that accuracy.

I dare say none here can equal the accuracy of my bench work at RF Power measurement here, even those with a shelf full of digital meters used as bookends for their library.

>>To wave a

Your counter is not an argument for their inexistence.

The examples of "traveling waves of power" abound, even to the trade craft of antennas. Examples of "traveling wave of power" are classic in whole to the explanation for the operation of the standard Directional Couplers (to distinguish them from the Bruene design).

There are more such examples, but the Directional Coupler is quite suitable to their class, and its operation satisfies the proof of power flow in both directions. There are other examples outside of this class that also provide proofs; and they are based on physical principles as well (polarization and magnetic moment).

Traditionally, these points pass in silence until some later time when we visit them once again.

The fact that an instrument may consume power from the circuit does not
imply that it measures power.

For example, a "voltmeter" that samples the voltage and draws a small
current from the cicuit under test does consume some power, but it cannot
"measure" power in the circuit under test without knowledge of the
complex load impedance.

I wrote an analysis of the Breune circuit and show that the meter
deflection is a response to the Vf or Vr component, and I dealt with how
that information can be used (including applicable conditions). If you
(or others) think there are flaws in the article, I welcome constructive
feedback.

> Rick K2XT

Hello Rick,

It will depends on the power, when it is up to several hundreds watts,
I think it is not likely.

Probably you will use about 3 or more radials, so the current and
hence the voltage at the end will not be as high as in the vertical
radiator. The strong E-field very close to the ends will generate
heat in fresh wood/leaves. However before the material will become
flammable, the water has to evaporate. When the water contents
decreases, the loss factor will decrease also. Because of this, the
heat generation per volume will decrease also.

Other issue is corona breakdown directly to foliage. Highest voltage
at the ends will be in case of quarter wave and 5/8 antenna. A Halve
wave will induce significant lower current into the radial system (and
hence lower voltage at the ends).

You might do an experiment and point the material in question towards
the end of the radials (parallel with the E-field lines and grounded).
Take some distance, turn on maximum power and afterwards (power of)
check for temperature rise. This may also show possible effects of
corona breakdown from the radial wire(s) to the material under test.

Best Regards.

Wim
PA3DJS.

Hi Owen,

Lower? That is rather astonishing in light of responding to my
comment.

>If I said it
>as you stated, I made an error. The common statement (and I have no doubt
>made it) that VSWR exacerbates line loss is actually wrong in the general
>case. (Having Googled my own web site I see one statement along those
>lines which needs further qualification!)

This is even more astonishing. Irrespective of you being the source,
why inject this confusing comment? SWR always exacerbates line loss!
Give me any normal line attenuation and SWR at the load, and I will
tell you exactly how much additional loss will occur. There's a
general solution for you.

Something tells me that your comments are based on a confusion between
the power loss of a cable, and its mismatch loss. They are not the
same thing although they are usually tightly twined in discussion. You
later exhibit a confusion between a conjugate match and an impedance
match. They are not the same thing either. The confusion on both
these points have abounded in this group in past "debates."

>I meant the output at the PA terminals where an lumped constant load
>would be attached for comparison.

This then removes the reflection from the argument, doesn't it? It
actually doesn't; but this unwarranted substitution is like Zen
Archery in that the line already demonstrates the validity of
reflected power as distinct from that "power" just being a
mathematical fiction.

Putting the lumped load at the PA terminal merely casts the proof back
into the box, it doesn't negate reflected power. As the proof is
already supported in the line, then removing it is not strictly a

valid counter argument. However, we will explore it further:

>PAs can be designed to behave as an equivalent fixed voltage or current
>source with fixed source impedance of Zo, but HF PAs are not usually
>designed in that way.

OK so we are now in my sidebar of source resistance. Even so, it has nothing to do with the concept of reflected power except insofar as that resistance's ability to reveal that power's dissipation.

Other's should ponder how the reflected power has a caloric proof in the line, and then question why it wouldn't prove out when it arrives back in the box where the temperature rises on its return.

Same source, same power, same reflection, same loss. The only thing that varies is the capacity of any point along this signal chain to support that heat burden. Let's skip these as choices of design.

>I know that there is a vein of thought that the process of adjusting a PA
>for maximum output always, somewhat magically, creates a match condition
>where the source impedance is the conjugate of the load at the PA
>terminals, but it is contentious.

That contention arises out of mistaking Z0 Matches with Conjugate Matches. This is a common affliction among "debaters" here. Let's skip their prejudices.

>What of broadband PA designs with no
>such adjustment, are they source matched over a broad range of
>frequencies?

Having had designed broadband amps, this is simply accomplished with the proper feedback such that, yes, they are matched over a broad range. The math is quite simple, the cost is another matter. Can you afford one? Probably not. The lack of commercial examples available to the Ham is not proof they do not exist. Let's pass on from issues of economy.

On the other side of the aisle, I've worked with active loads that will absorb as much power (up to a limit) at any frequency (up to a limit) that you care to throw at it.

>Observations are that experiments to discover the source
>impedance by incrementally changing load current can produce a range of
>values for the same PA on different frequencies, and at different power
>levels.

This is called "Load Pulling," and is a classic technique to demonstrate source Z. Thevenin first described it and Norton followed suit. I cannot, for the life of me, recall any other intellectual giants that have pulled these apart.

I have done this with my own gear. The variation from a source Z of 50 Ohms wandered the SWR range of 1.5:1 over all bands and most power

levels. Given this conformed to the manufacturer's specification, I
was not particularly surprised. Where it deviated the most, the rig
also operated the worst. What can we say about experience and
performance design converging?

>Why do amplifiers with say tetrodes and triodes which exhibit
>such different dynamic plate resistance but requiring the same load
>impedance deliver the same equivalent source impedance?

A cable connector instead of binding posts? Let's dismiss this as
being obvious.

>I am also aware that supporters of the inherent source match position
>assert that you must be selective in choosing tests for source impedance.
>It is all rather unconvincing when only some of the implications of a
>particular source impedance are effective.

Where is the rig specified to exhibit this condition?

Is your rig a VW that stalls trying to pull a trailer from a stop in
3rd gear? Or is it a Mack truck trying to park in the handicap zone
in an underground mall parking lot? Arguing other's incapabilities is
something I like doing, but with more flair. Let's skip these
Tritonic minnows.

>It is my view that modelling the PA as a fixed voltage or current source
>with fixed source impedance of Zo, and where reflected waves on a
>transmission line are absorbed by the matched source is not a good
>general model for HF PAs.

You have already said as much. I see nothing new so far.

>The application of small signal analysis to amplifiers that sweep from
>near cutoff to near saturation is suspect.

If it is near cutoff or saturation, it is suspect small signal
analysis. Certainly, anyone can conspire to fail gracelessly. Would
you care to elaborate the suspicion beyond the evidence of gross
negligence? Why don't we skip this minor excursion?

>I believe that it is sound (in the steady state) to resolve the forward
>and reflected wave voltages and currents at the source end of the
>transmission line, calculate the complex impedance, and predict the
>effects of that impedance as a PA load using the same techniques that
>were used to design the PA.

Sound though it may be, if I were to line up another transmitter
boresight down the antenna connector of the first, light it up to
provide power with no equivocation of it being fictional; then yes,
all things may appear to be the same. ...and yet I have just
demonstrated reverse power arriving at the antenna terminal (where did
it go?). My having experience in doing just this (aka active load
already described above) fully conforms to your sound idea, and yet,
as for myself, it is not an idea I would rely on to deny the existence

of reverse power nor its capacity to fry the innards of a transmitter
(active loads are heavily heat-sinked and fan driven).

Do you need fast tuning from band to band?

Can you see the antenna from where you operate?

Do you want to operate while actually driving, or just when you're
parked.

I had a screwdriver on the roof of my VW Passat for a while. It was
tedious to adjust because I didn't have feedback about where it was
set. I then moved it to the front bumper, and it was a lot easier to
do band changes (you can quickly see when you're in the right
region). Worked greate for 10,12,15,17, and 20, because you can tune
to a visible mark, and then just check SWR. However, it's still a bit
tedious to tune for 40 and 75, because it has a pretty sharp
resonance, so if you QSY very far, you have to readjust the antenna.

There are some newer screwdriver antennas with automatic controllers
that make life much easier. They can count turns, or actually look at
the reflected power and adjust up and down for the match. However, you
still have the "tuning speed" issue.. that motor only moves so fast.

And, no matter how you look at it, you're only adjusting one parameter
(series L), which limits the best possible match you can get.
Granted, with the lossiness of a typical screwdriver, and the usual
clever 4:1 transformer with leakage C, you can do pretty well. better
than 2:1 from 10-40 is no problem and you can probably do somewhat
better.

A whip and auto tuner at the base of the antenna, on the other hand,
is virtually instantaneous to tune and requires no manual intervention
on the part of the operator. Squeeze the pickle and you're matched
and ready to go. I suspect that the loss in the tuner is not
materially different than in the variable loading coil, particularly
when you consider the mismatch from only having one adjustable device,
and besides, the dominant efficiency issue is going to be from having
a physically short radiator on lower frequencies, which is the same
regardless of how you tune it.

I didn't have very good luck with a single whip on a SGC tuner, (as
far as getting a match on all bands) but when I improvised a dualband
whip by wrapping another wire around the first whip (say, 25-30 ft of

AWG 16 hookup wire) and connecting them at the base, it works quite well. (this is similar to what's inside the SGC whips and other similar wideband whips... essentially it's like having two verticals in parallel, with widely varying resonant frequencies... when you're close to the resonance of one, the other just looks like a lumped L or C in parallel, and the tuner takes it out)

> frequencies.

This is just not true. A SteppIR does it mechanically by changing the element lengths. A 4 square does it by switching ports around on a phasing network. One can buy everything you need to build a generic 4 element HF phased array with computer adjustable LC networks for less than a few thousand dollars. (see, e.g. LDG's AT200PC tuner with an RS232 interface)

The Yagi Uda overcomes this problem at a slight cost in
> gain. Your idea of an antenna with multiple fed resonant elements is a

> estate for huge arrays

hardly backwards. Phased arrays may well save the day in this era of ever increasing community resistance to traditional Beam on rotator on tower installations.
>
> Antenna with multiple resonant element all being fed is very common in
> RADAR and space communication, you can achive very high gains in this
> manner just as you have stated.

You can get low gains too. or just sharp adjustable nulls, which is probably more useful.

It is also very expensive, has narrow
> bandwidth and is a mechanical nightmare.

Expensive compared to what? We're not talking about a electronically steered phased array radar here with thousands of elements. I'll bet the hardware cost of a electronically steered phased array for HF suitable for ham use is comparable to the hardware cost of a big tower, rotator, and Yagi.. the phased array just isn't available as an off the shelf product yet.

NASA, AM BCB, commercial
> shortwave stations and various other agencies and private companies
> sometimes have a need for this type of antenna and they they have the
> money to build them, few hams do.

A ham could build an adjustable directional array of verticals,
essentially identical to an AM broadcast directional array, for
several thousand dollars. Yep, that's a bunch o'bux compared to a
Rockmite and a wire over the balcony railing. But it's not a bunch
o'bux in the context of a big station with a legal limit amp, a state
of the art transceiver, etc. If you're willing to homebrew and
scrounge, you can build computer controlled phasing networks with
stepper motors (or servos), roller inductors and variable caps.
Adjusting it is non trivial, but so is learning Morse code, or how to
use NEC or lots of other things in ham radio.. it's just not
particularly common. All the math and design information is laid out
in detail in ON4UN's book, with the implementation left "as an
exercise for the reader".

Well, let's think of it this way. You sure wouldn't grab hold of the end of a quarter wave vertical with a kilowatt of power applied to it. Same for the end of a single raised radial because it would have similar high voltage on it, would it not? We would put a big old insulator on it to support it if this was our antenna configuration, right?
Ok, say we laid the one radial made of insulated wire on the ground. Now the earth would detune it ???????? Would it still have extremely high voltage at the end? And if so, could it arc to earth? That was my question. I really dont have 1 radial at the present time, I have 20 so the current divides 1:20 and the resultant voltage at the end of each radial may be nothing to be concerned about. I don't know, that why I asked on this cold winter night.

Just to deal with this issue, line loss under VSWR, which at first seems
a side issue, but it illustrates one of the problems of a "power
perspective" in analysing a transmission line.

By "line loss" I mean the ratio of power at the load end of the line to power at the source end of the line, not "forward power" or "reflected power", but the average rate of flow of energy at those points.

So, to your challenge:

The problem is 1m of Belden 8262 (RG58C/U type) at 3.5MHz with three loads, 50+j0, 5+j0, and 500+j0.

The loss for 50+j0 load is 0.025dB (equivalent to the Matched Line Loss).

What Line Loss to you get for the other two cases?

(I make it 0.24dB for 5+j0, and 0.014 for 500+j0.)

Depends on what you mean by better.

One caveat on autotuners; most I've looked at will be marginal at
tuning a 102" whip on 40 and won't tune lower than that.

If you decide on an autotuner, read the specs carefully before you buy.

Hi Owen,

What's wrong with conventional terms so that we BOTH know what you
mean? The convention would call this Mismatch Loss. If you dispute
this, then it serves my complaint. Further, convention has no
interest in "forward power" nor "reflected power" except as expressed
as SWR. I thought I was quite terse in this regard.

>So, to your challenge:
>The problem is 1m of Belden 8262 (RG58C/U type) at 3.5MHz with three

Well, as I've pointed out, it is not strictly in the terms of my
challenge, is it?

>The loss for 50+j0 load is 0.025dB (equivalent to the Matched Line Loss).

Sigh... parentheticals?

>What Line Loss to you get for the other two cases?
>
>(I make it 0.24dB for 5+j0, and 0.014 for 500+j0.)

An additional 0.1dB However, this example strains the utility of the
challenge.

Let's try a perverse challenge.

Presume a source of 100+j0 Ohms impedance sees a 50 Ohm line that is
5.35 wavelengths long and is terminated with a load of 200+j0 Ohms.
The normal attenuation of the line is 2.00 dB. What is the loss in
the line?

Can your general solution solve this? It uniquely describes both the
kinetics of reverse power flow AND the impact of source resistance.

No one has every answered this one correctly, by the way (and I can
anticipate you are ready to spring that observation on me with your
source feeding essentialy a voltage oriented high Z load as opposed to
the current oriented low Z load).

For the others,

Any who complain about their transmitter having:
1. No source resistance;
2. Not this much resistance:
3. Not this little resistance;
4. None of the above (the usual response).
can take heart that if you simply substitute a tuner which presents
the equivalent SWR at the plane of the input to the line, then you can
progress to the solution with equal fluidity (which is to say like
molasses in December).

This particular example has been around for at least 40 years if not
since WWII. No one has rushed to answer it here in at least a quarter
of that time, I don't expect a cascade of guesses soon either.

I was thinking it might be interesting to make a ferrite choke that you can
slide on the coax to tune the antenna. You might not have to slide the whole
choke just a bead or two that you can move a few inches.

Jimmie.

Richard,

Your challenge was "Give me any normal line attenuation and SWR at the
load, and I will tell you exactly how much additional loss will occur."

I didn't state the VSWR, but it is 10:1 in both cases. The "normal line
attenation" you refer to is I expect the Matched Line Loss" which I have
given you.

>

>
> An additional 0.1dB However, this example strains the utility of the
> challenge.

Is that your answer, an additional 0.1db due to the 10:1 VSWR? We do not agree on either answer.

BTW, my figures were not additional loss, but total Line Loss as I defined it.

You will note that my calculation for the 5+j0 case is less than the Matched Line Loss, not higher.

In practical transmission lines, most of the loss is in current flowing in the R component of an RLGC equivalent of the line, the loss in the copper conductors forming the line. For VSWR>1, the net current varies along the line forming the classic standing wave pattern, and the loss in incremental lengths of the line varies approximately with the square of current in that increment.

So in the two cases above, even though the load VSWR is the same, the loss is quite different due to the different current distribution in both cases, one is near a current maximum, and the other is near a current minimum. Any adjustment of Matched Line Loss for VSWR>1 using only the VSWR cannot take the location of the standing wave pattern into account, and is an inaccurate approximation in some situations.

Many books showing a VSWR based formula for "additional loss due to VSWR" don't spell out the assumptions underlying the formula. Phillip Smith does in his book "Electronic Applications of the Smith Chart", he says "If a waveguide is one or more wavelengths long, the average loss due to standing waves in a region extending plus or minus a half wavelength from the point of observation may be expressed as a coefficient or factor of the one way transmission loss per unit length." and he gives the ratio as (1+S^2)/(2*S). Though the ARRL shows graphs and formulas they don't always (if ever) spell out the assmptions.

So, yes I assert that the Line Loss under mismatch conditions may be less than the Matched Line Loss.

Owen

PS: I calculated my answers using http://www.vk1od.net/tl/tllc.php , Dan's TLDETAILS.EXE and ARRL's TLW3.EXE give similar results.

And 160 and 80 and 40 is where these antennas have there niche. Where the
big yagi isnt so popular or practical. I wouldnt think of putting up a Yagi
for 80 either but I might put of a couple of towers I can run in or out of
phase.

Richard,

If you read and understood the article, you would see that the instrument is based on sampling the V/I ratio at a point, and that being surrounded by transmission line is not important to the principle of operation, in other words, it does not directly measure a reflected wave.

I agree with your theory. I once had a vertical with one horizontal radial which
was about two feet off the ground. It was fed with open wire line.
The design came from the ARRL handbook. To me it would
be similar to an inverted Vee set in an odd position, and the HV should be
present at the end of the radial however I never really did anything to
check it out with respect to HV at the end -- maybe just as well!

Hi Owen,

I already anticipated that, didn't I? Certainly parsing my last discussion is hardly necessary.

I note you have no solution that answers for the loss in a fairly typical instance for a fairly typical line condition. It couldn't have been any more difficult than your former computations, could it? (In fact it is, but not conceptually.) And yet the absence of that effort is notable (OK, so you've been ambushed). I may have stumbled on a novelty application but I didn't trip over a boulder of a common usage.

Given this sub-thread flowed from my response that a source does dissipate a reverse power flow (both of which, the direction and dissipation, are held in contention); and further given my "perverse" challenge fully specifies such a condition and has a real solution, it stands to reason that if your general computation is in fact general, then it can resolve the contention to one or both of our satisfaction. All it requires is that your math treatment accepts both directions of power flow, and loss in the source. This is not unreasonable, especially when any number of references encompass just such concepts.

Jeep? I'd go for the 102" whip and tuner, or a set of tuned hamsticks on spring mount. Wouldn't even consider the screwdriver unless you always stay on the pavement and don't live in an area with trees next to the highway/street. Now here's why...

I have a Yaesu FT-857 with the digital option (nearly the same as the 857D, which is newer) and when I initially installed it, I had the Yaesu Atas-120 Screwdriver, which I mounted on a "rollbar loop" behind the cab on my Toyota Tacoma 4x4 pickup. It worked fine, auto-tuning under command from the 857 merely by pressing the tune button, for bands from 40 meters up (even underway at speeds up to 55, which is the speed limit here in Hawaii). However, I eventually took if off after replacing the whip three or four times (the last time, I drilled out the mount for a larger diameter whip from a hamstick antenna). Yep, you guessed it already, overhanging trees killed the whips, over and over.

The other problem I had was that I had to re-solder the "matching base" to it's internal PCB twice, as vibration would cause the solder joint to fail. Nothing fatal, but clearly a pain in the butt.

After putting up with the issues of periodic soldering and whip replacement, I moved to a Hamstick mounted at the left rear corner of the truck, using 1 1/2" square steel tubing bolted to my hitch receiver. The tubing has a 3/8-24 adapter connected to it, with about 18" of pipe with another adapter, and a spring on top with a quick disconnect for the ham sticks. Moving it up 18" from the bumper level made the hamstick get out better, and gave them both a wider bandwidth and lower swr, but of course, they had to be retuned when I added the 18" pipe extension. I've had the whip bend back a bit in the wind, and at "passing speeds" the entire hamstick leans back about 20 degrees or so, but still gets out just fine. I haven't broken a whip on the hamstick yet, though it does take a minute or so to pull over, jump out and swap antennas to do a band change. Oh yeah, going through a drive-through gets me some really wierd looks if I forget to hop out and unplug the whip, because it drags over the ceiling of their drive-through awning if I don't (looks sort of line the power bar above a bumper car at that point). I keep the bands of choice (usually 40, 20 and 15 or 17 depending on mood) in the pickup bed, so I don't need to mark the whip to make them fit inside. Normally run on 40 meters because we have a daily net here on 7.088 at 0200 Zulu. (4 pm local time in Hawaii). Bandwidth on 80 is pretty narrow, but usable if you have a relatively narrow interest there. The 40 meter and higher frequency bands get out pretty well, I've had contacts to mainland US (2300 miles minimum) on 40, with world class contacts (Russia, Australia, South America, Japan, etc.) on 20 meters, and up. Used to talk to east coast on 10 meters in

the morning hours a couple of years ago, but haven't been out in the truck much lately, working on building a house right now...

Another thing about the screwdriver: When I had the Atas-120 screwdriver on, I made it a snap-lock mount, so I could fold it over the bed of the truck when I parked in the garage. It also snapped over when I forgot to lower it before I drove into the garage, so I didn't kill the antenna.

If you ever enter a parking garage you'll have to have a way to fold or remove the screwdriver or youll kill it. A jeep with a 102 can just be pulled over and held down with a short cord you can remove after you get back outside.

Hi Owen,

Can you express it without the presumption and still carry the
argument? I have read and understood many treatments on the topic,
and none claim to be the sole and unadulterated truth as it is
generally understood that many analyses work simultaneously and none
deny the validity of the others.

You have not yet actually offered any treatment that denies the bone
of contention that lies in two subject lines:
1. Reverse power is manifest;
2. The source will absorb and dissipate it.

You may have struggled with others over this in times past, but by
your own descriptions they had little intellectual horsepower, and
less experience in the matter.

I have attended schooling specific to these issues, and have practiced
professionally in their measure to the highest of standards. My peers
have instituted national metrology laboratories in your half of the
planet (OK, so it was Korea).

I have measured SWR with Bruene designs (as vulgar as that is);
Directional Couplers, Slotted Lines; and power with half a dozen
different style of sensors, and as many different methodologies. I
have also calibrated these instruments (all of them including the
vulgar Bruene designs). I can separate out the constituent waves (in
spite of the denial of their existence) by several means - each
appropriate to the problem at hand. I can measure excessively high
SWR precisely where others would shrug and simply call it infinite (it
isn't). I can also reduce residual SWR (anyone know what that is?).
I've done this over a spectrum from nearly D.C. to 12 GHz. And I get
a chuckle out of a claim for 0.014dB loss when I know full well
through experience it is unverifiable, unmeasurable, and hence
unproveable except in a spread sheet as a statistical curiosity.

Richard,

No, it is just that I have not posted a solution as yet.

Your problem was described as "Presume a source of 100+j0 Ohms impedance sees a 50 Ohm line that is 5.35 wavelengths long and is terminated with a load of 200+j0 Ohms. The normal attenuation of the line is 2.00 dB. What is the loss in the line?"

Rather than sit down an write a bunch of stuff to calculate it, I took the lazy way out and played with a scenario using Belden 8262 (RG58C/U) in my line loss calculator that was pretty close to your scenario (Zo is a touch different at 50-j0.24, most lines with loss will have a non-zero jX component in Zo). My result for 15.8m of 8262 at 67MHz with a 200+j0 load is a transmission line loss (power into the load divided by power into the line at the source end) is 3.3dB. This value of line loss is independent of the source equivalent impedance.

If I reproduced the algorithms with the exact propagation constant and Zo for your problem scenario, the answer would be more accurate, but I think similar, and still obtained independently of the source impedance, and not worth the time.

The figures from the calculator are below if someone wants to play with it.

Now, are you prepared to post your solution?

Owen

>

The fully steerable phased array that can also handle 1.5kW TX power is not available as a HAM product off the shelf yet... but we can already see where the future is headed.

Many people already have four-square phased arrays for the lower HF bands, but we have hardly begun to tap their true potential.

The design company Plextek has a downloadable demonstration which shows what a four-square phased array can really do:
http://download.plextek.co.uk/AKS06.zip

The user interface is a bit clunky, but stay with it...

The program starts with an omnidirectional pattern, receiving signal 1 coming from 90deg (blue arrow at 3 o'clock). The thermometer bar at the top right is showing a positive signal/noise ratio (green).

Click in the 'Interferers' columns to bring up either one or two interfering stations which are the yellow arrows. The thermometer bar now shows a negative s/n ratio on the wanted signal (red).

Now the fun starts: in the 'Algorithm' column, click on 'SMART' to turn on Plextek's proprietary adaptive array software - watch the phased array reconfigure itself automatically. The pattern adapts to null out *both* of the interfering signals, while still keeping a lobe pointing towards the wanted signal. The wanted signal reappears from under the QRM and its s/n ratio increases dramatically.

You can then drag the interfering signals to different directions, and the array keeps on adapting. The only case where it can't give any improvement is where the interfering signal comes from exactly the same direction as the wanted signal.

All this is done by varying the amplitude and phasing of the signals from each of the elements before combining them. The 'WEIGHTS' table at centre right shows what is required. On transmit, the same directional patterns could be achieved by applying the same weightings to the currents that are fed to the four elements - or of course you could switch to a different pattern while transmitting.

OK, this is only a demonstration. It doesn't consider signals at a range of different vertical angles; it doesn't consider the big practical problems of achieving the correct current weightings when all four elements are interacting; and it doesn't consider how to handle the TX power. Even so, it will open your eyes to what a phased array can really do.

It's all down to the magic phasing box at the centre of the array. Whatever goes into that box will be hard to design, complicated to control, and expensive to build... but most four-square owners would be happy to have even a fraction of those extra capabilities.

Richard, if you go back over my postings in this thread, I have not denied either of these things.

I did comment on 2 as an explanation, one which I think is poor because of the conclusions that might be drawn from it, eg any mismatch creates reflected power which must be dissipated in the PA.

I did suggest that in the steady state, in a tx-line-load scenario, the impedance looking into the line can be found, and that equivalent load adequately explains the PA's behaviour.

A 200 ohm load on a 50 ohm line is 4:1 at the load end in my view, and it
is lower as you move toward the source.

Indeed; 4:1 decreasing to 3.2:1 at the source, BUT only when the source is 50ohms.

Change the source impedance to 100ohms and the picture changes to 5.5:1 at the load and 4.75:1 at the source end.

By the way the vswr figures will change cyclically with frequency assuming a fixed length of coax (5.35 wavelengths at a fixed frequency), between about 7.5 and 2.5 at the load and 7 and 1.5 at the source.

Hi Richard,

Not that I dispute anything here necessarily, but I would like to know how you went about measuring the reflected power dissipated within a source. Also, how the power being dissipated?

Thanks and regards,

Jim, AC6XG

Yep, SWR and feedline decoupling are pretty much totally unrelated.
It's possible to have a great match, and horrible decoupling from the
line.
And visa versa.. Or versa versa, or visa visa..

>JS ruminated
>I DID find that the coax wanted to couple into the antenna and become
>part of it (the sleeve itself was NOT a sufficient de-coupling device.)

It's not a decoupling device at all really. It's the lower half of the
antenna. A sleeve
half wave needs additional sleeves for decoupling. There are quite a
few
commercial variations that can be looked at. Many were built as heavy
duty VHF public service type antennas. The extra decoupling sleeves
can
be applied to the usual ground planes also. For VHF, etc, I usually
prefer using
sleeves, cones, radials, etc vs the usual rf choke or beads.

What have I missed about "it is not supported by fact?" What do you
mean by "is a popular belief?" I am swayed by facts and I don't
really like general statements that are couched in belief systems.

Hi Owen,

It is surprising the conclusions I've drawn from our correspondence
then. As I've steadfastly expressed nearly every posting in these
terms, you have not exactly responded to my misunderstanding in an
uniform manner.

I shall return to those postings to enquire further rather than
laboring the point here.

>I did comment on 2 as an explanation, one which I think is poor because of
>the conclusions that might be drawn from it, eg any mismatch creates
>reflected power which must be dissipated in the PA.

This is not a denial? I see no positive characteristic you have
derived from 2 as allowing it is acceptable.

>I did suggest that in the steady state, in a tx-line-load scenario, the
>impedance looking into the line can be found, and that equivalent load
>adequately explains the PA's behaviour.

Yes, this allowing reflected power in your terms, allowing you to
express it as a fiction suitable to providing a truth in creating the
lumped equivalent. This may have the heavy hand of my
editorialization, but it is forced by the equivocation I find in your
points I am responding to here.

>> You may have struggled with others over this in times past, but by
>> your own descriptions they had little intellectual horsepower, and

>
>I never said such a thing, if it is your conclusion, I disagree with it.

As I have never raised the discussion of "others" or how "they" developed poor explanations or subscribed to faulty premises; then my perhaps over-arching characterization is what you are rejecting as your having said. You may note that at that time I explicitly offered that their contributions were not germane to the facts.

As to point 1 (or 2 it is difficult to determine what you are
responding to specifically), explicitly stated by me, you have
expressed your self in relation to "supporters of the inherent source
match position" without actually identifying if you stand
1. With them;
2. Against them;
3. Indifferent to them.

As to point 2, explicitly stated by me, you have again described
yourself in a negative relation by discussing a model that does not
work.

Perhaps it is this style of ambivalence that clouded my appreciation
of your statement:
>I believe that it is sound (in the steady state) to resolve the forward
>and reflected wave voltages and currents at the source end of the
>transmission line, calculate the complex impedance, and predict the
>effects of that impedance as a PA load using the same techniques that
>were used to design the PA.
where you do allow 1 and 2.

However, I could be mistaken again because you don't actually acknowledge return power impinges upon the final stage, you transform it into another solution. Note that I accept such a transformation of the problem. It is common alternative explanation and perfectly valid. However, that transformation, in and of itself, does not speak to the issue of reflected power as a physical fact and a separable entity. In fact, the development of a lumped equivalent doesn't need to acknowledge SWR either.

>Now, are you prepared to post your solution?

Hi Owen,

Your quick computation of 3.3 dB is suitably close to my reference's first pass solution (3.27 dB), but it neglects the contribution of the source's resistance.

The solution is 4.9 dB.

If we were to revisit your 1 meter long cable used in the 80M band and force the transmitter to be a voltage source through the common mechanism of adding a substantial resistor, and mismatch the other end of that 1 meter long cable to the same degree (each end seeing 10K Ohm for the purpose of this statistical curiosity); then that same cable will heat up with its contribution of at least 3dB of ADDITIONAL loss.

The 10K Ohm specification is a forced one, but it responds in kind to the original forced solution too. In fact, it comes close to the source resistance found in a tube amplifier (a common voltage source) driving a halfwave element (a common application for such a source) and demonstrates the common futility of using coax (that I have already expressed) to accomplish this.

However, we don't have voltage sources to conveniently solve either of these statistical curiosities. Both the tube transmitter, and the solid state transmitter employ impedance matching to either draw down, or pull up the native source resistance to a level suitable for applying to a transmission line.

I would again point out that reverse power suitably accounts for the 1.6 dB difference between your answer and the solution, it also accounts for the 3 dB difference between your short cable's example, and my twist in its application.

All such differences have been described and used in design for quite a few decades, and they have been couched in exactly the terms I've used here.

If anyone wants to challenge the 4.9 dB solution, they can impeach my reference "Reference Data for Radio Engineers," (various editions). I can supply other references that have been named in this group too, but I would suggest with tackling one authority at a time.

Hi Jim,

Dissipation is caloric, however it can arrive catastrophically by one
of two mechanisms; and they reflect, no pun here, the two types of
phase sense offered by the random opportunity (being phase adding or
subtracting for current or voltage as the occasion demands).

One caloric method is simple in measuring the heat load expressed by
airflow temperature measurements in a confined volume. When I
designed the Flight Recorder, the FAA mandated a heat budget for its
acceptance. This is certainly far afield from the immediate topic,
but it responds to the attention offered in design to this issue. The
point of this sidebar is that efficiency translated immediately into
temperature and this was rigorously anticipated and tested. The same
design philosophy is mandated in RF final design and considerable
attention has been devoted to it in the trade papers.

Returning to our concerns, for certain phase combinations that caloric
solution can arrive suddenly in the form of an arc. Most operators
will immediately act to correct that situation and the heat build up
may not be great, but the damage may still be irreversible. This
harkens back to my discussion of a kitchen table laser cracking a
window pane. Average power may be unspectacular, but instantaneous
power, localized, can be very dramatic and destructive beyond
expectation (it certainly surprised my friend).

For other phase combinations that caloric solution can arrive
gradually (heat soaking); and catastrophe arrives through thermal
runaway. Operators rarely observe this until it is too late.

I hope that the readers can differentiate between these two, and how
certain designs (eg. solid state, and tube design) respond in these
cases and correlate to experience each to their own characteristic
failure mechanism.

Aircraft electronics lives with a common airduct. Your design must
not load the cooling air such that it becomes a flame thrower into the
next instrument in the stack. I won't go into issues of crash
survivability.

>Returning to our concerns, for certain phase combinations that caloric
>solution can arrive suddenly in the form of an arc.

I'm sure most readers who run tube rigs will recognize this situation
immediately. However, there is more than one combination of phases
and currents/voltages. I have also seen heat soaking arrive at a tube
to watch the plates glow cheerily. This, too, is probably an
experience borne by several tube rig operators. In fact, it can be
tolerated far more than a solid state amplifier, and tubes are noted
for their resilience. However, I have also seen the glass envelopes
turned into a taffy consistincy and the vacuum draw them like
heatshrink around the internal structure. Surprisingly, I have also
witnessed that these tubes still worked!

>For other phase combinations that caloric solution can arrive
>gradually (heat soaking); and catastrophe arrives through thermal
>runaway. Operators rarely observe this until it is too late.

The latest generation of solid state components have survivability
design into them such that they are specified to operate into an
infinite mismatch (or some such similar claim). This is suitably
taken care of by being able to withstand more voltage. Other issues
of current crowding, the original thermal disaster for transistors,
has been long solved. That solution revealed how the problem was in
heat confined to a small volume.

>

Finally, my measurements were never pushed to the point of failure.
All may well anticipate that this sudden arrival would preclude any
accuracy in the heat determination to demonstrate a quid-pro-quo of
returned power. Further, once the failure occured, heat is usually
removed by the very failure it brought - it usually removes the source
too. ;-)

Lest there be any doubt about there being concurrent explanations,
this loss is also expressed in lumped equivalency and circulating
currents. It can be correlated to a very common issue with literal
lumped circuit antenna tuners. It can also be described in terms of Q
and cavities. It can also be correlated to short radiators, radiation
resistance, and Ohmic loss.

Each description is accurate, and as varied as the authors each
offering their interpretations, but no explanation denies the validity
of the other, and reflected power in a line is no exception.

Message-ID: <Xns98E64D38131A0nonenowhere@61.9.191.5>
Source record: 45343

Breaking out of the previous thread to explore the "power explanation" in a steady state situation:

The scenario for discussion is a transmitter connected to a half wave of 600 ohm lossless transmission line connected to an antenna with a feedpoint impedance of 70+j0.

The transmitter is rated for 100W output, 100W is developed in the 70 ohm load, the VSWR on the transmission line is 8.6, the "forward power" (meaning Vf^2/Zo) on the transmission line is 267W, the "reflected power" (meaning Vr^2/Zo) on the transmission line is 167W, the DC input power to the transmitter is 200W.

The questions are:

Is there any internal inconsistency in the scenario characterisation, if so, identify / explain?

What is the heat dissipated in the transmitter (and why)?

What part of the "reflected power" of 167W is dissipated in the transmitter (and why)?

Hello all,

I have a mono-band 20-meter vertical currently mounted only about
12 feet up (less than a quarter wave). There are 4 radials and it tunes
very well - very low VSWR across entire band, with decent signal reports.

Question: If I were to rent a cherry picker, I could mount the thing on
the end of the peak of my house, at about 40 feet up. That would put the
bottom of the radials at greater than 1/4 wave.

But would I notice any difference? If so, would it be potentially
dramaticly
better, or just 'technically' better? It would be a major project to do, so
I'm
trying to decide if it would be worth it or not.

Thanks,

Dave WB7AWK

Dave:

"Higher the better" is the golden rule.

I'd venture it would be noticeably better. But, rent a cherry picker?
I usually find much more reasonable ways to achieve decent heights ...

Download the free version of EZNEC, and run simulations at both heights. I
would look for differences in gain and vertical radiation angle.

What I meant was, in what way were you able to attribute and apportion this heat to its various sources? What evidence were you able to obtain to show reflected energy re-entering the source output? What component in the system in fact dissipated the reflected energy? How were you able to determine the exact source and amount of energy at any given location within the source? Or did you just presume that you understood the underlying mechanisms?

Thanks in advance,

Jim AC6XG

Your example is the same as putting a load resistor on an open
transmission line, measuring the dissipated power, and then claiming
the same thing happens without the load resistor there.

> Is there any internal inconsistency in the scenario characterisation, if
> so, identify / explain?

i think the best answer is... it depends.
it depends on what the radio looks like to the reflected power.
for instance, if the tx output network included a circulator and dummy load,
then the reflected power would be lost and there would be no way to get 100w
into the load.
however, because of the conditions given it would appear you have assumed a
perfect re-reflection of the reflected power at the tx end of the line so
everything balances perfectly.

>
> What is the heat dissipated in the transmitter (and why)?

200w dc in, 100w rf into load, lossless line, sounds like 100w dissipated in
the tx to me.

>
> What part of the "reflected power" of 167W is dissipated in the
> transmitter (and why)?

none. it is all re-reflected back toward the load.

Hi Jim,

This knowledge arrived by many avenues.

For one, in a heavily heatsinked design, mapping of temperatures
generally reveal a very diffuse origin. That, of course, is the
purpose of the heatsink. So, in that regard the assignment of where
dissipation occurs is done by induction. You can eliminate a lot
circuitry as being incapable of supporting this dissipation, as it is
both remote from the signal path, and remote physically. The
literature of design reveals much of what is discovered in the field.

That literature reveals the dissipation occurs in the
emitter/collector junction of the finals' transistors. Failures have
been confirmed through post-mortem examination by microscope (no, I
have not done this).

Experience with new designs and frequency of failure (those activities
that I have participated in) lead to the same conclusion. In one
particular case it was a manufacturing/assembly problem of mounting
the transistor to the heatsink. A bur was found in many such mounts
that interfered with a complete mating of surfaces. This raised the
thermal resistance in the path from that same junction to the mating
surface, to the heatsink, to the environment. Knowing each thermal
resistance in that path makes it rather simple to forecast the
junction temperature at the time of failure (or rather, to say failure
which occurred was guaranteed a fatal temperature) when you know the
power consumed by the component. All such "resistance" conform to the
simple math of Ohm's law (once you substitute the necessary units for
heat).

When we return to the design guidelines and this junction, almost
every manufacturer of power transistors specifies a junction
resistance value at rated power. Casting this value through the chain
of transformations and to the antenna connector reveals a value very

nearly 50 Ohms. There are newer power amplification designs today, and yet the market for Ham gear is dominated by the Class AB design which is exhibits this property nicely.

Inductive logic leads us to this junction as the principle target of reflected power (the signal path is symmetric, after all). Experience has supported this logic. Failures are attributable to design flaw (or assembly flaw), or poor application (driving a mismatch), or both.

As for tubes, I've already testified to the obvious location for dissipation. It is far easier to see.

Most engineers equate the units of power to power, i.e.
joules/sec = watts and so does the IEEE dictionary. But I
am content to assert that the joules in the joules per
second of a reflected wave is real energy. Do you disagree?

Yep, the great majority of amateur radio antenna systems
are matched by a tuner. That act of matching prohibits
reflected load energy from reaching the PA. Except for
overall efficiency, when an antenna system is matched,
the PA impedance doesn't matter. A 5 ohm PA, a 50 ohm PA,
and a 500 ohm PA all output the same power if the output
voltage is the same into the same load.

IMO, you missed the most important questions.

Is the amplitude of the energy stored in the transmission
line when steady-state is reached exactly equal to the
amount it takes to support 267w+167w = 434w of total power?

What happens to the 434w of total steady-state energy stored
in the transmission line when the source is disconnected?

No, it is more akin to presenting all the evidence.
Your approach is akin to rolling dice in the dark
where you are the only one allowed to report the
results. :-)

Are you willing to assert that the power being
dissipated in the circulator resistor didn't
make a round trip to the load and back even though
the actual delay is easy to measure?

Do the reflected waves that you see when looking
at yourself in the mirror contain any joules/sec?

There is a conceptual exercise that I use on such problems.

Source---1WL 70 ohm line---+---1/2WL 600 ohm line---70 ohm load
Pfor1=100w--> Pfor2=267w--> 100w
<--Pref1=0 <--Pref2=167w

Now the picture becomes perfectly clear. The insertion of 1WL
70 ohm line doesn't affect the steady-state condition. A 70
ohm Z0-match is achieved at '+' so none of the 167w is dissipated
in the transmitter. What happens at point '+' toward the source
is total destructive interference, i.e. no reflected energy. What
happens at point '+' toward the load is total constructive
interference. Reference "Optics", by Hecht, 4th edition, page 388.

rho at '+' is 0.791. That makes rho^2 = 0.626.

The amount of Pfor1 that makes it through the impedance discontinuity
at '+' is Pfor1(1-rho^2) = 100w(0.374) = 37.4 watts - call that P1

The amount of Pref2 that is reflected from the impedance discontinuity
at '+' is Pref2(rho^2) = 167w(0.626) = 104.5 watts - call that P2

The power equation says that Pfor2 = P1 + P2 + 2*SQRT(P1*P2)cos(A)

Since it is a Z0-match point A=0 so cos(A)=1. Therefore,

Pfor2 = 37.4w + 104.5w + 2*SQRT(37.4w*104.5w) = 267 watts

What do you know? The power equation works perfectly. Pfor2 didn't
even need to be given.

Source record: 45357

Hello All,

As a young SWL, I loved reading all the posts & antenna discussions posted here. I lived in a small, 8'X8' bedroom and dreamed of the time that I would have some room to really have one, very efficient and effective antenna/transceiver combination. That time has arrived, I passed my General exam last Saturday.

I currently live on a 3+ acres at the 2,000+ elevation. It faces North on a rather precipitous slope.

I have read ON4UN's book, but I am very interested in your thoughts. First, let me tell you where my interests lay.

I am close to making the purchase of a IC-755DSP; I would very much like to feed this wonderful transceiver with an equally wonderful, efficient and durable antenna. I am very interested in working 160 meters, at first.

There are several equally efficient dipoles on the market; Alpha-Delta DX-EE, WA2Nan's Tru-Talk, Par Electronics End-Fed half wave, Cobra UltraLite Senior or the G5RV's that are manufactured by both Antennas & More, as well as HF Antennas.

I've just noticed that Antennas & More produces what they call their "OmniLoop", which is 560' long.

Each antenna will easily fit on the property, but I was hoping that your personal experience with one of these could help me finally decide.

Many thanks for taking the time to respond!

Alain

Here's the equation for rho at the load.

rho = (Z0-Zload)/(Z0+Zload)

SWR = (1+rho)/(1-rho)

I don't see the source impedance in those equations.

Hi Owen,

After a fashion, yes. You don't have enough information. The lesson
of past correspondence reveals the source resistance is not a benign
element that can be discarded in the examination of these problems.

Explain? I thought I had by example, so to continue by simple
analysis we have to ask: "What is the source R?"

If it is 70 Ohms, it sees a 70 Ohm load and an Impedance Match. In
effect there is no other way for a transmitter that is capable of 100W
being able to source 100W to a load, is there?

If it is 50 Ohms, it immediately sees a mismatch at the connector -
you did do your lumped equivalent of the transmission line system,
didn't you? Hence a transmitter limited to supplying 100W could not
supply 100W to a mismatched load.

If it is 600 Ohms, we again see a massive mismatch, further discussion
is unnecessary as being repetitive.

>What is the heat dissipated in the transmitter (and why)?

I will skip that exercise as obvious pending discussion below.

>What part of the "reflected power" of 167W is dissipated in the
>transmitter (and why)?

Presuming the 70 Ohm source as it is the only one capable of supporting the 100W application of power to the 70 Ohm load (by your definition and limitations) we shall proceed to the determination of those pesky powers with absolute finality.

The load voltage is 84 volts (to sufficient accuracy). The voltage at the source port is 84 volts (to sufficient accuracy). The line has been defined to be lossless. The same potential at the same angle is returned to the source through 360 degrees of travel and no loss (analysis allows us to treat the load as a generator). That signal applied to the transmitter finds there is no potential difference, and thus there is no current flow. This variously describes either a short or an open; and either way it represents an infinite mismatch - ALL the reflected power is re-reflected to the load.

Voila, another statistical curiosity!

Tuners do this more generally and we use tuners to re-reflect the power, and to not suffer the transmitter the additional heat burden of reflected power arriving at the finals.

If we repeat this exercise with the other source resistances, we stand to appreciate a paradox in the initial condition of:
>the DC input power to the transmitter is 200W.
forcing us to resolve the additional heat burden (roughly 50W) exceeding the reflected power's ability to contribute that much (especially when all the reflected power is re-reflected); or worse, the source going into clipping. A non-linear source is not a pleasant thing to behold.

This is worth trying, too and I had thought of it. Too bad I don't what type
ferrite material I have (all junk-box recoveries, swap meet, etc). I
figured on a low probability of success, but with failure so cheap, quick
and easy -- what the heck!. ;-)

I have pressed material which was not suppose to work, into working. I
have used type 26 material effectively at 10 meters and above, meaning
20, 40, 80, 160m. (sucks on 6m though :( ) If there is a will, there is
a way. May not be the most efficient--but ya' can make it work!

An inductance meter is a crucial tool, but you can get the plans for one
on the net which will use your fet-vom or vtvm and get ya' by!

I think it might be a bit of time before it's an off the shelf product
(lack of demand is part of the reason).
It also depends a bit on just how good you want the performance to be
(null depth, primarily.. forward gain is not very sensitive to phasing
and amplitude accuracy), and whether you want to make it an antenna
system that just hooks onto an existing rig and PA, essentially
hanging off a single feedline, or whether a higher level of
integration is desirable or feasible. (for instance, rather than power
combining a bunch of solid state amp modules like the current kilowatt
class SSPAs do, put a power module on each antenna)

"the magic box in the center of the array" is more the former model,
and while simple conceptually, in the long run probably isn't the best
way to solve the problem in a system context. For instance, a multi
channel receiver, which can do all the phasing, very precisely, at low
levels, either with analog or digital processing, can give you the
nice deep nulls and adaptation.For TX, though, null depth isn't as
important as maximizing the power squirted in the right direction.

Hardware wise, the design isn't particularly complicated (any of the
current crop of automatic antenna tuners can serve as the building
block). Hard to control is mostly a matter of calibration and the
right algorithms (and, yes, non trivial, but so is building a tetrode
or FET power amp that's stable from 10 to 160, etc.). Expensive is
more a matter of "compared to what".. You can buy a kilowatt autotuner
for $500, so, assuming you needed 8 of them to control 4 elements (a

single L network can only give you 90 degrees of phase shift, and you need 180).. that's $4K. Probably need some relays and transformers, as well as controller. I'd figure $6K, today.. But that's "off the shelf" assemblies. and not purpose designed. Start comparing that to the $10K to put up a tower and a Yagi (comparing new prices to new prices, plus building permits, etc.) and the phased array starts to be competive.

So.. not today, but I'd figure that in 10 years, you'll start to see real broadband phased arrays (not just 4-8 switched beams in a single band like a 4 square). They provide a real solution to restricted space installations, if nothing else, because you can make effective use of the "volume" of space within a small suburban lot (i.e. the max theoretical gain from an antenna that fits in a box that's say, 15x30x10 meters is pretty high).

Your analysis is fine if the source is matched to the coax, but you are neglecting the mismatch at the source to coax interface.

If you used a TDR, for example, to look at the set-up you would see 2 points of discontinuity, firstly at the 100 ohm source to 50 ohm cable interface, and secondly at the cable to 200 ohm load. BOTH of these discontinuities add to the overall mismatch as seen by the 100 ohm load.

Your application of the above equations neglects the first discontinuity.

I have to admit to an error in my analysis of the problem, I made a mistake
with the attenuation of the line.

Re analysing with the correct values gives me the following:

Loss 4.78dB
S11 -5.25dB
Vswr as seen by the source 3.41:1

I think these values are close enough to Richard's answers to make little
difference. I have not got Reference Data for Radio Engineers to hand, but
it may be a graphical solution that could account for the slight
discrepancy. My figures were obtained using Ansoft Designer RF Cad package.

The error crept in because I did the analysis by using 5.35m of coax at 300m
to get the 5.35 wavelengths, and forgot to scale the attenuation value for
the coax.

Your TDR does not work in the steady state frequency domain space, and is misleading you.

In the steady state, the (complex) ratio of forward voltage to reflected voltage is determined solely by the load impedance and characteristic impedance of the line.

In crude terms, during establishement of steady state, you can view that a load end reflected wave which is then partially reflected at a mismatched source end, will reach the load end and be reflected in the same ratio as the earlier passes. The subsequent round trips as steady state is approached do not change the (complex) ratio of forward voltage to reflected voltage in the steady state.

I know you have support here for the assertion that source end mismatch affects VSWR in the steady state, but you won't find it in reputable text books.

Reminding you that your question was "What is the loss in the line?",
check your own post.

Well, you posted an answer, not a solution. It wouldn't have been your
solution anyway, because it looks like it is copied straight out of a
book.

Looking at Reference Data for Engineers, Sixth Edition, p24-12, Example 3
(which is the same as the problem you posed), they give the answer as
3.27dB.

I am happy that my answer rounded to 3.3dB is correct.

The source resistance has no influence over the line loss at all.

You posed this problem as difficult and one that no one has ever got
right. No wonder, you have a different answer to the the book!

What utter rot. The TDR indicates a discontinuity that is IN ADDITION to the one that gives you your result. Ignoring that discontinuity will certainly give you the wrong answer, regardless if which domain you are working in!!!

Well it certainly does not agree with Ansoft Designer, the result it gives
is very close to Richards, and it shows a marked effect when you change the
source resistance.

With a 50 ohm source and 200 ohm load the loss is calculated as is 3.93dB
and VSWR is 3.98:1
Changing to a 100 ohm source the loss is calculated as is 4.78dB and VSWR
is 3.41:1

So a very well respected CAD package agrees with Richard at least!!

eeah, just another structured programing language.

The latest seems to be 'D'.

A statically linked program, particularly one which is object based,
would result in a hefty sized binary. But it would work.

The first discontinuity (inside the source) doesn't
have any effect on the SWR on the transmission line.
Tuners at the source present another discontinuity
and have no effect on transmission line SWR.

The discontinuity is NOT "inside the source", it is at the source to coax
interface, and as such effects the VSWR that the source sees.

> Tuners at the source present another discontinuity
> and have no effect on transmission line SWR.

There are no tuners involved in the current example.

When line loss is given in watts, the discontinuity
at the source certainly has an effect.

When line loss is given in dB (10x log of a ratio),
the discontinuity at the source has NO effect.

The discontinuity at the source has NO effect on
the RATIO of two powers.

Looks like your losses and VSWR are taken on the wrong
side of the source resistor.

source R
source V----x--/\/\/\/\/\/\--y----T-line---load

Loss and VSWR should be calculated at 'y', not at 'x'.
We are interested in the VSWR and losses *on the T-line*.
Please change your reference point from 'x' to 'y'.

There is usually a piece of coax running from the
source connector back to a filter. I would suggest
that the discontinuity that you are talking about
is indeed some distance "inside the source".

But we users don't care or measure what VSWR the source
sees. Only the PA designer worries about such. We users
only care and measure the VSWR *ON* the transmission line.

Don't forget that by raising the antenna, you avoid obstructions from your
house, neighbouring houses and foliage. I suspect those can be
significant.

I don't know the minimum height above ground (in wave lengths) that
make the improvement in an antenna. However, Steppir antennas says
that an antenna on the ground needs 120 radials just to match one in
the air with two radials. I would like to know where the noticable
benefit of raising an antenna above the ground actually takes place
and where is the maximum benefit.

I know that the higher the better, but rather than that kind of
benefit, I am wondering from a ground standpoint where the benefits
start and where the point of diminishing returns begins.

Good luck with your antenna.

Owen and Cecil are right: the source (transmitter) has no effect
whatever on the VSWR on the line.

That isn't just an assertion - it is part of the bedrock transmission
line theory. Owen referred to "reputable textbooks", one of which would
surely be 'Theory and Problems of Transmission Lines' by R A Chipman
[1]. This book gains a lot of its reputation from its very complete
mathematical development of the theory, showing all the detailed
working.

Chipman treats standing wave patterns in two different ways: first by
assuming the final steady-state conditions, and then in much more detail
by considering multiple reflections between the load and the source.
Given a sufficient number of reflections, the multiple-reflection model
converges on exactly the same results as the steady-state analysis -
just as it does in the physical world.

VSWR on the line is determined by the ratio |Vmax|/|Vmin|. The complex impedance that the source sees at the input terminals of the line is the ratio V/I at that point (where V and I are both vector quantities which include phase information). An alternative way of calculating either VSWR or Zin is through the ratio Vforward/Vreflected (again vector quantities).

All of these approaches are alternative pathways through the same body of theory. They are all consistent with one another, and there is no contradiction between any of them.

You will notice that all these standing wave relationships involve ratios. Chipman's detailed analysis confirms that these ratios are determined EXCLUSIVELY by the properties of the line and the load - never the source.

The source properties do determine the magnitudes of all of the individual voltages and currents - but when you change the source properties (output voltage and/or impedance) all the individual voltages and currents on the line and at the load are changed by the same factor. So when you take the ratio, the source properties cancel right out again.

All this confirms that, if you sweat out the math in all the different levels of detail that Chipman did, the source (transmitter) still has no effect whatever on the VSWR on the line.

[1] Out of print, but well worth searching for: ISBN 0-07-010747-5. The web bookstores currently have eight copies on offer, at a range of prices.

I am sorry but you are not correct, I have not read Chipman so I cannot comment on his analysis or your interpretation of his results, but my understanding , practical experiments and CAD analysis would lead me to disagree.

If we take the situation where the source is matched (50ohms) to the 5.35 wavelength transmission line (lossless to simplify things) with a 100ohm load, I agree that the vswr is 4:1, unchanging with frequency.

Plotted on a Smith Chart when swept against frequency this gives a circle centred on 1 (50ohms) with a radius of 4. i.e. on a constant VSWR circle.

Now if we change the source impedance to 100ohms and repeat the same sweep and re-plot, keeping the chart normalized to 50 ohms, the circle moves on the resistance axis, still with a radius of 4 and now passing though 2 (100 ohms) resistive. The centre moves to about 0.6 (30ohms). It then becomes obvious that the locus of the circle is NOT a constant VSWR against frequency.

You will come to the same conclusion if you normalize the chart to 100 ohms, the new source impedance and re-plot.

The coax is acting as an impedance transformer, causing a shift along the resistance axis.

Looking at it another way, the vswr changes sinusoidally with frequency, in our example, between 2:1 and 8:1. (The same as the Smith chart plot with a circle of radius 4 centred at about 0.6).

I can't speak for most engineers, but I think the first time I saw it was in high school physics, and of course later in engineering school. That was about 35 years ago. I think of it a fundamental concept - one that I happen to understand very well. Not unlike the relationship between Joules and electron-volts.

> But I
> am content to assert that the joules in the joules per
> second of a reflected wave is real energy. Do you disagree?

I don't agree that the terms power and energy become interchangeable by virtue of the fact that their units can both be expressed with the word Joule in them. One can find himself making unrealistic predictions if he is not precise in his application of the ideas which underlie these terms.

The Z0 of the transmission line has not changed to 100
ohms so normalizing the chart to 100 ohms is not valid.

It is just as valid as using 50 ohms, and the result is the same, a changing vswr.

I see you have not commented on the main point of my post, that being that the smith chart shows a changing vswr when you change the source impedance.

Hint: transmission line transformers would not work if the vswr did not change.

>Reminding you that your question was "What is the loss in the line?",
>check your own post.

Hi Owen,

Can you offer why I should? Well, I suppose not or you would have.

However, I am one to never turn aside a suggestion and I did review
everything (except my own quote - I've repeated it enough, haven't I?)
and I will respond to that review within the body of this text.

>Well, you posted an answer, not a solution. It wouldn't have been your
>solution anyway, because it looks like it is copied straight out of a
>book.

Does it being someone else's solution make any difference to the
outcome? Owen, your comment reveals a prejudice by implication.
Copying it right out has removed any issue of authority has it not? It
has also removed any issue of accuracy too - if you accept that
authority. Ultimately, having copied it out makes for the best
resolution. Having copied it out, and offering the citation, gives us
both access to the chain of evidence. Did I withhold or otherwise
linger with the citation? You asked for my solution and I immediately
offered both.

Ironically, does your suggestion that
>It wouldn't have been your solution anyway
mean you would suspect I would have come up with a different answer?
That is, ascribing to me the quality of being able to get it right
instead? That would be generous, thank you. However, it appears I
fell short of that mark (and may have been the intent of your
elliptical pat on the back).

>Looking at Reference Data for Engineers, Sixth Edition, p24-12, Example 3
>(which is the same as the problem you posed), they give the answer as
>3.27dB.

A simple review of example four distinctly reveals the details to the
problem I posed; example three contains only some of them. Example 3
is a subset of example 4 (as that example dwells on at great length).

However, example 4 does have one notable difference, it asks:
"What is mismatch loss between the generator and the line?"
for which the answer is:
"1.62 dB"

Ah, the devil is in the details. Continuing from example 4:
"The transducer loss is found by using the results
of 3 and 4 in (4). This is
1.27 + 2.00 + 1.62 = 4.9 decibels"

>I am happy that my answer rounded to 3.3dB is correct.

Congratulations. You may note in my earlier correspondence I allowed exactly that.

>The source resistance has no influence over the line loss at all.

Upon review of my own reference (not the recommendation you offer above) I must concur. I was trapped by what I have already described as being the classic confusion between systems of match and loss. My solution was not for the loss in the line, but for transducer loss, and specifically for the inclusion of mismatch loss within the transducer loss. All caloric, but mis-ascribed to the line loss.

>You posed this problem as difficult and one that no one has ever got
>right. No wonder, you have a different answer to the the book!

Well, in fact my answer conforms exactly to the book. The problem is not one of inexactitude, it is of poor referencing. As to the matter of no one else having ever got it right, no one even consulted the book - even partially. You can count yourself among a population of one and hashing it through served us well.

But primarily, it seems, by speculation. I know how to measure heat, Richard. What I am asking, and what you have thus far been unable to answer (which is as I suspected), is how is it that you were able to ascertain that this heat energy was caused by energy that was reflected from the load rather than having come directly from the power supply within the source? How is it that this electromagnetic energy is so easily reflected from a load, but is utterly immune to reflection when it encounters the output of a source? I think it's been fairly well established that the output impedance of these things is far from 50 ohms. Why should reflected energy not be, at least in some part, re-reflected back toward the load?

Someone who alleges to be so familiar with load lines should be able to contend with an increase in dissipation against a mismatched load without having to explain it as 're-absorbed' reflected energy.

> Inductive logic leads us to this junction as the principle target of
> reflected power (the signal path is symmetric, after all).

Speculation could also lead to that juction.

That's why I am willing to switch from the words "Reflected Power" to "Reflected Energy" and measure that energy flow past a point on a transmission line in joules/second. Thus "power" and "watts" are dropped from the discussion along with any semantic disagreements over the definitions of those words.

So the question is: With a forward RF energy flow of 200 joules/sec and a reverse RF energy flow of 100 joules/sec, would you agree that there is 300 joules of energy existing in a lossless one-second long transmission line? i.e. exactly the amount of energy required to support the forward RF energy wave and the reflected RF energy wave.

Or if the above transmission line is one microsecond long, that 300 microjoules of energy exists in the line, i.e. exactly the amount of energy required to support the forward RF energy wave and the reflected RF energy wave.

>So a very well respected CAD package agrees with Richard at least!!

Hi Jeff,

Thanx for the flowers, and sorry for having been myopic in my correspondence and restricting my comments to response to Owen.

HOWEVER, those flowers may wilt in my hands.

That congruent result you found with my writing and what you have found in your CAD work, sadly, does not conform to the question put.

This has been an object lesson in the difference between mismatch loss and line loss. Such issues are frequently polluted through the course of discussion, and by polluted I mean that two or more concepts are combined as though they were one.

This thread has revealed just such mixture, other threads often violate the separation of Conjugate Matching and Impedance Matching.

On the other hand, there is an upside, to you as an innocent bystander who has participated through your own analysis. Before they wilt, I hand that bouquet back to you for your discovery of how much impact source Z has upon the SYSTEM.

Ultimately, that was my point all along. Having arrived there after deviating from the straight and narrow and having plunged into the slough of despond, redeems me (Owen, that was copied, or rather lifted, too, from "The Pilgrim's Progress from This World to That Which Is to Come," Bunyon, John, 1678 However, I only include this citation so that Art can sneer at his heritage in association to spitting on me. Any originality that I can claim is in my sense of irony.).

I have other wallows in that slough to be revealed, as soon as Owen gets to them in his "power explanation."

SNIPPED

Energy FLOW implies a unit of time. Flow indicates a flow rate. In the absence of a flow rate you are discussing static conditions.

Conclusion: all the illogical rational in the world does not change the understanding of energy flow > energy/unit time > = power = watts = joules/second pass a point or dissipated.

Cecil, as an engineer you should stick with standard vocabulary.

> vswr.

No, the center of the Smith Chart is the Z0 of the transmission
line (when used on a transmission line). One cannot willy nilly
change the reference Z0. The confusion from doing such is obvious.

> I see you have not commented on the main point of my post, that being that
> the smith chart shows a changing vswr when you change the source impedance.

I think I see the problem. It is an *error* to change the
Smith Chart reference point when the source impedance
changes while the T-line Z0 and load remain the same.

> Hint: transmission line transformers would not work if the vswr did not
> change.

Hint: A lossless series-section transmission line transformer
has a *constant SWR*. It is the *constant SWR circle* that
causes the impedance transformation.

A fixed-constant SWR on 300 ohm line looks like it changes
when measured with a 50 ohm SWR meter but that is an illusion.
The SWR meter *must* be calibrated to the Z0 of the
transmission line in order to obtain a valid SWR reading.
The impedance is indeed being transformed all around the
constant SWR circle.

With your software, you are conceptually doing the same thing
as using a 50 ohm SWR meter on a 300 ohm transmission line.
The meter reading is invalid when taken at face value. The
meter reading does NOT indicate a valid SWR on the 300 ohm
feedline and neither does your software.

It proves that the reflected energy made a round trip
to the load and back. If there is no such thing as
reflected energy, how is that possible? If it is
possible in a system with a circulator load, why
is it not possible when the circulator load is removed?

I think it depends on how long the energy has been flowing. But in the steady state it's rather like posing this question: With a forward speed of 200 knots, and with a headwind speed 100 knots, would you agree that the apparent airspeed of the aircraft is 300 knots?

> Or if the above transmission line is one microsecond long,

Or even if the forward energy is 200 microjoules/sec, reverse of 100 microjoules/sec through a 1 second transmission line.

It's kind of a boring problem though. Personally, I think it's more interesting and enlightening to consider what goes on prior to steady state.

In the theological sense, this predicates that power never becomes
dissociated from "the source." That is ambiguous, isn't it?

Is that to include the batteries behind the collector supply? The
power supply charging the batteries? The power grid feeding the power
supply? The generator driving the grid? The Coal firing the steam
spinning the generator? The sun through photosynthesis growing plants
to provide the coal? The previous supernova that seeded the cosmos by
which coalescence formed the sun? ...and into an infinite regression
to that previous supernova?

The energy dissipated is computed from the Galactic Load Line.

> Cecil, as an engineer you should stick with standard vocabulary.

Just trying to appease the physicists, Dave. They are
arguing that it is not power until work is done. They
say that since reflected energy is not doing any work,
it cannot be reflected power. Therefore, reflected
power doesn't exist. It's purely semantics. The very
essence of an EM wave is its energy content.

So the real question is: Since standing waves obviously
exist and just as obviously cannot exist without two
coherent waves traveling in opposite directions, does
reflected energy exist? (That question seems to cause their
skivvies to get all bunched up.)

I will just be happy when they admit that reflected
EM waves possess a certain amount of energy that cannot
stand still and according to the theory of relativity
must necessarily travel at the speed of light.

Dave,

I couldn't agree more. Energy flow is correct. Power flow is a bit
more controversial. In some cases the notion can lead to power being
reflected, algebraically summed, and it can ultimately interfere
constructively and destructively. It can even, by making exactly the
right misinterpretations, end up changing direction without the aid of
a reflecting surface. That's why it can sometimes be important to
make sure the hairs are properly split. :-)

If you are asserting that VSWR on a real or even theoretical line varies sinudoidally with displacement, it is time to go back to basics. You need some time with a reputable text book.

Sarcasm clearly noted, and surprisingly uncalled for. I'll try asking
one more time. It is a simple metrology question: How were you able
to directly ascertain that the heat being dissipated in the source was
produced by energy being reflected from the load?

Thanks,

Of course, I was talking about steady-state conditions.
And I can prove that there is exactly the amount of
energy stored in the transmission line necessary to support
the forward joules/sec and reflected joules/sec readings.

Why violate the laws of physics to try to come up with some
other more esoteric explanation than forward and reflected
EM traveling wave energy moving at the speed of light?

> It's kind of a boring problem though. Personally, I think it's more
> interesting and enlightening to consider what goes on prior to steady

That's exactly what I have done. During the initial transient
build-up period, *exactly* enough energy is supplied by the
source to the transmission line to support the steady-state
forward and reflected joules/sec - no more and no less. If
the source is disconnected during steady-state, the energy
stored in a lossless transmission line is dissipated in the
load during that final transient decay period.

That is very true. Unfortunately, the ham market is divided up into physically separate compartments of transceivers, power amplifiers and antennas. That is a severe restriction which makes all the technical challenges much more difficult.

However, we can try to pare the problem down a little.

Another important point is that the concept of 'market demand' is beginning to break down in ham radio. The big manufacturers are increasingly challenged by new products that pay no attention to the

market - they spring directly from some individual or small team deciding they're going to do it.

Then maybe the design is produced as a kit, or manufacturing is taken up by some lower-tier company that is faster on its feet. Seems good to me...

>For instance, a multi
>channel receiver, which can do all the phasing, very precisely, at low
>levels, either with analog or digital processing, can give you the

>important as maximizing the power squirted in the right direction.
>
That seems a good place to cut the problem down to size. By all means continue to use the existing phasing networks for TX, with 4 or 8 switchable directions and fixed phasing; but switch the antennas over to a totally separate network for RX.

At the lower power levels, the RX network could be much more complex and versatile, combining the signals from the four (say) antennas with amplitudes and phasing that could be varied on the fly.

Another way to scale down the problem is not to be too ambitious about automatic null steering. In ham operating it is often difficult for a computer to identify which is the wanted signal and which is the QRM, so maybe let's not try. Semi-automatic null steering definitely would be within reach, where the user has a control to steer the null direction manually for the best audible results, and the computer does the math to select the required network parameters.

>
>So.. not today, but I'd figure that in 10 years, you'll start to see
>real broadband phased arrays (not just 4-8 switched beams in a single
>band like a 4 square).

Yes, I think maybe so. We already have most of the technology for an advanced manually steerable RX array, so it's mainly a matter of integrating the separate parts of it to make a practical design. Someone just has to decide to do it... and maybe they already have.

Hi All,

Well, in lieu of Owen providing his own solution, much less
fulminating against the BS provided by yours truly in the quote above
(how seductive is it to the rest of you?). The problem here arises
out of a mixture of models, but this topology is not my choice and it
is inclined to invite such problems.

We can look at the details provided to find a 600 Ohm line terminated
at both ends by 70 Ohm resistors (again, I am forced to the
presumption of the source resistance, but given the constraints it is
the only value available). The energy within the resonant line is
ringing (one reason why a mismatched line it is called resonant is
because of circulating energy - the allusion to ringing).

If we deposit ourselves in the line, within the fields of energy, it
would be like inhabiting a hall with two partial mirrors, one at each
end. To other descriptions, these partial mirrors are leaky
interfaces. Some of the energy is passed through, some is reflected.
The "some" can be rendered into an absolute through knowledge of the
degree of mismatch - it is already provided within the original post
as being 8.6:1 (to a sufficient accuracy). In this regard, the
resonant line has a poor Q, however "poor" is in the eye of the
beholder because a flat line has the poorest of Qs at 1 (or worse).

The topology, and the question, invited me to respond with both the
lumped equivalent (this topology is in the classic expectation of
repetition of the load, cast back identically through a lossless line
to its input) and a Thevenin analysis (200W of power applied to a
source that could only supply 100W). The topology here has the
classic expectation of 50% efficiency that only a 70 Ohm source can
provide. Given that there is special constraint of a very strongly

specified line length, that too invites an analysis (which then corrupts the lumped equivalent analysis if they are not separated).

So, we have three avenues commingled here in pursuit of an answer as to explaining the power. Let us return to that hall of mirrors and traverse its length (and unfortunately it must violate another expectation of steady state, but this topology, much less expectations galore, was not my choice - but I wander into any discussion with so many invitations).

The first pass of energy sees the partial mirror of the load interface. Some energy passes, some reflects. That which passes cannot supply the expected potential of 84 volts (to a sufficient accuracy); that remains to be justified by further analysis. The reflected energy approaches an IDENTICAL mirror at the source end. The reflected energy is coherent to the source (this is enforced by the topology) behind that mirror. However, and revealing my deception above, the reflected energy is not the same amplitude. There are two sources of energy now embracing the source resistance of 70 Ohms. There is a potential difference across that source resistance that is different from that of what would be a presumed steady state 84 volts (to a sufficient accuracy). Others can provide that computation if they wish as the magnitude is one of degree (pun intended).

We have COOLED the source resistance! But we have not provided the full load (anyone want to bet we cooled it by an equal degree? - pun intended again). And the 200W application must be accounted for somewhere (this inclusion is, of course, a sham of moving between topologies and expectations that are so inviting).

And so on, and so on, ad infinitum through the successive waves of reflection and dissipation for this statistical curiosity for me to once again conclude:
>ALL the reflected power is re-reflected to the load.
which is to say, energy (through the corruption of terms that has been generally allowed).

Agreed, but make that a textbook that specifically deals with the
subject in enough detail. Chipman was highly recommended by contributors
to earlier rounds of this debate. It isn't an easy read, but it's
certainly thorough.

I ordered the book from the other side of the world because I wanted to
be very sure of my answers next time around. We don't know where you
are, Jeff, but it would probably be easier and cheaper for you to do the
same.

> change the reference Z0. The confusion from doing such is obvious.

You are mis-representing what I said; which was that you can plot the problem using with the chart normalized to EITHER 50 or 100 ohms (the impedance of the generator or that of the line) and the net result will be the same answer.

The chart does not necessarily be normalized to the impedance of a transmission line that you are trying add, otherwise you would never be able to include a series line of an impedance other than that of the chart in a matching network.

No, I am saying that a fixed length line, mismatched at the far end, and of a different impedance to that of the generator, will not present a constant vswr to the generator with varying frequency. That variation being sinusoidal between a max and min value.

Hi Owen,

Under the right circumstances (and they have been presumed in some
discussion here), then the power terms (as expressed by a power meter
inserted into the line) will vary sinusoidally with displacement, even
if the SWR does not.

No, I cannot see any.

>
> What is the heat dissipated in the transmitter (and why)?

Approximately 100W. It is reasonable to assume that all DC power into the transmitter is converted to RF power output and heat. The heat then is approximately DC power input minus the RF output power. Since the power in the load is stated to be 100W, and the line is stated to be lossless, the power out of the transmitter must be 100W, and given the stated DC input power of 200W, the transmitter heat dissipation is approximately 100W.

>
> What part of the "reflected power" of 167W is dissipated in the
> transmitter (and why)?

None. The notion of the "reflected power" is part of describing the field setup / energy storage / energy flow on the transmission line. It follows

from trying to reconcile the restriction the Vf/If=Zo, and Vr/Ir=Zo with the V/I ratio of the circuit attached to the transmission line.

The problem defined the standing wave effects on the line. The transmitter sees a load of 70+j0 due to the antenna and half wave lossless line, and must be delivering 100W to that apparent load so as to achieve the stated antenna load power.

Any notion that reflected power *must* flow back to the source and is dissipated as heat will not lead to the correct solution of this problem.

As an exercise, think of a generator that has a Thevenin equivalent of some voltage V and a series impedance of R+j0, connected to a half wave of lossless transmission line where Zo=R. To give a numerical example, lets make V=100 and R=50, so Vr=50 and "reflected power"=50. How much of the "reflected power" is dissipated in the generator. In this case, the generator dissipates less heat than were it terminated in 50 ohms.

When I said that the reflected power explanation is not a good explanation, I did not say it was necessarily invalid, but it is my opinion that it provides an incomplete explanation that folk with limited knowledge and supported by ham radio folklore like to use to explain things that are not necessarily explained by that explanation (if you are still with me), for example why a transmitter (sometimes or necessarily) gets hotter when the antenna VSWR is high.

The point is that it is best to use one Smith Chart
for each Z0. Trying to plot multiple Z0's on the
same chart leads to the present confusion. The
fact that a piece of transmission line with an
SWR<>1 transforms impedances is NOT proof that
the SWR is changing. It is *only* proof the
the impedance is changing and that happens
with constant SWR.

Changing the length of the ladder-line changes the
50 ohm SWR seen by the source. That is a well known
fact. But that doesn't mean the SWR on the ladder-
line is changing. It simply means that the impedance
is being transformed by the constant SWR circle.

Richard,

I am not sure of what you mean by the "right circumstances".

Firstly, except in the very special case of an almost purely inductive load on a lossy cable at low frequencies, the VSWR calculated from Vf and Vr at a point on a line, decreases smoothly from the load end to the source end. (Vf and Vr each decay exponentially in magnitude from source to load, and the forward and reflected power values calculated from those samples will vary as the square of the exponentially decaying Vf, Vr from load to source.)

If you use an instrument that is calibrated for an impedance other than the line under test, your measurement does not indicate VSWR on the line under test, and the instrument readings will be different than I outlined in the previous paragraph. Fig 3 in my article at http://www.vk1od.net/VSWR/VSWRMeter.htm shows a line labelled "VSWR(50)" that indicates the values that would be indicated / calculated using a 50 ohm instrument in a 75 ohm cable with a 1.5:1 VSWR.

> 73 for now

> Buck
> N4PGW

I decided to run EZNEC on a 20 m vertical with 4 radials sloping 45 degrees.
Here is what I got:

HEIGHT GAIN V-ANGLE

15 ft 0.1dbi 19 deg
32 0.54 14 deg
40 1.25 47
0.51 12
100 3.31 8

The 40 foot height has a double lobe, but the gain at 12 degrees is more
than the 15 foot gain at 19 degrees. Now I know why the DL I worked on 20,
with a vertical on the roof of a 24 story apartment building sounded so
good.

<gm3sek@ifwtech.co.uk> wrote:

>I ordered the book from the other side of the world because I wanted to
>be very sure of my answers next time around.

Hi Ian,

It will contain much of interest. For instance, it relates to Owen's
moribund thread "the power explanation." Page 205, third paragraph
from the bottom conforms to one of my recent posts there:
"Although the power delivered by the source to the line is thus
shown to be reduced by the amount of the reflected power returning
to the input terminals ... the implication of the latter reasoning
that the reflected wave power is entirely absorbed in the source
impedance without affecting the total output of the signal source
generator, is incorrect."

Contrary to that teaching, is discussion on page 203, last paragraph.
It relates to figure 9-26, clearly illustrating a mismatched line fed
by a source with a source resistance. This may be upsetting to many:
"At the signal source end of the line ... none of the power
reflected by the terminal load impedance is re-reflected on
returning to the input end of the line."
The ellipsis reveals that the source Z matches the line Z.

To begin at the beginning of multiple reflection coverage, go to the
same named section (8.8) on page 174. It is not his complete say on
the topic, but it starts here formally. To add insult to someone's
injury, his math includes source Z. However, by the same token
Chipman explicitly states:
"... the shape of the standing wave pattern ... is in no way
affected by the quantities Vs, Zs and Rho-s at the source."

I would also note the irony in that Chipman expresses reflections in
lines in terms of power. To subdue that irony, I would also admit he
is quick to shift to energy when the usage of power is to lead to
problematic solutions (so, using power as an expression in this
context is allowable by precedent as being informal).

Of course, Chipman must be accepted as an authority for any of these
issues to be considered valid.

>I am not sure of what you mean by the "right circumstances".

Hi Owen,

It should be under "all circumstances." However, to reveal it
requires the "right circumstances." This again returns us to the
discussion of source resistance/impedance. A matching source driving
a mismatched load through a line of indeterminate length can exhibit
this variation, but it will require considerable skill to see it. If
you force the problem by mismatching the source as well (this then
means that the line is mismatched at both ends, much like your
halfwave model); then you can observe a variation in power readings
along its length that vary sinusoidally.

>If you use an instrument that is calibrated for an impedance other than
>the line under test,

That is not the case, although there are occasions where power has to
be determined in a heavily mismatched situation - this is done with
considerable error if the line lengths are unknown. If they are, then
corrections can be made.

>your measurement does not indicate VSWR on the line

I have restricted myself to the cyclic display of powers.

>under test, and the instrument readings will be different than I outlined
>in the previous paragraph. Fig 3 in my article at
>http://www.vk1od.net/VSWR/VSWRMeter.htm shows a line labelled "VSWR(50)"
>that indicates the values that would be indicated / calculated using a 50
>ohm instrument in a 75 ohm cable with a 1.5:1 VSWR.

Well, at a quick glance and noting no tabular form of data, what is
presented wouldn't reveal cyclic variation anyway for two reasons:
1. It lacks resolution (not enough places);
2. It lacks sufficient mismatch.
This is not a complaint, merely an observation because the evidence
for your example is hidden deep in the decimal places.

The solution is simple conceptually and mathematically. Reference any
discussion of Two Beam Interference as treated in Optics. For the
special case the math devolves to:
I = 2 ï¿½ I1 ï¿½ (1 + cos(theta2 - theta1 - delta))

Conceptually, it is only the combination of phase and amplitude from
two sources (each reflecting interface on the ends of the line).

Hi Owen,

Why must it flow back, when the generator itself presents a huge mismatch to the line? The laws of reflection work at both ends of the line and to force the presumption that initial reflected power would flow through this discontinuity without reflection is a strained expectation. However, I see by the alteration that follows, that we now have a fully matching source:

>As an exercise, think of a generator that has a Thevenin equivalent of
>some voltage V and a series impedance of R+j0, connected to a half wave
>of lossless transmission line where Zo=R. To give a numerical example,

>the "reflected power" is dissipated in the generator. In this case, the
>generator dissipates less heat than were it terminated in 50 ohms.

"reflected power"= 50 what? Watts? So be it. Your intent may not to be incomplete nor difficult, but what is wrong with specifying the load? Do we get a line length?

Let's see, I start with your termination of 50 Ohms to find 1 Amp flowing through both source and load resistances. 50 Watts each. Now I move to a load that will reflect 50 Watts - the former load's complete contribution. I presume by this you mean either an open or a short at the load end. As you left it unspecified, and it being my choice, I can show that the source resistor will get hotter than a $5 pistol. I will, however, be complete and discuss how the source resistance dissipates the reverse power for both short and open.

To cut to the chase, and not knowing the length of the line, we have a spectrum of choices, but we may as well force the situation with another resonant line any number of lossless halfwaves.

It is obvious that the two powers combine constructively or destructively. One is with the energy reflecting a zero voltage component and all the current (or now twice the current through the source resistance), the other is with the energy reflecting an identical voltage component, and none of the current flows. As I've offered, the spectrum of possible answers yields to the same analysis, this was simpler.

Both times the reflected power had to be absorbed by the source
resistance. It does not mean that contribution has to always resolve
to more heat (haven't I already demonstrated this in this thread?).

I will at this point re quote Chipman to roughly this scenario (being
more general, he didn't specify the reflection).

"At the signal source end of the line ... none of the power
reflected by the terminal load impedance is re-reflected on
returning to the input end of the line."
The ellipsis reveals that the source Z matches the line Z.

RoomCap antenna and NEC

There is a large family of antanna simulation programs of NEC
like EZNEC, MMANA, 4NEC2, NEC-2, NEC-4 etc.
These programs can produce excellent results in designing and
optimizing of beams and similar antennas.

Personally, I made very good experience by optimizing the well
known Spiderbeam. The results of the simulation proved to be
fully correct in the practical field tests.

However, there are many cases where the simulation with NEC
programs is failing.
You may obain results indicating efficency of over 100% !
This is not the discovery of a "perpetual motion machine", it is
an error of computer simulation ..., or the results may become
very inaccurate if there are varying diameters, different
dielectricas etc.

The NEC programs are designed primarilly for wire
constructions and can be used for other constructions only
under specific conditions.

Regarding my RoomCap antenna the question was rised many
times, how the NEC simulation would look like.
Here I can say very simply: This construction can not be defined
by the existing NEC programs.
Especially the central element, the Varylink, can not be defined
by NEC. Discussions with the well known NEC expert L. B. Cebik,
W4RNL have revealed, that a way will be searched to include
such elements in later editions of the programs.

This example shows once more, that the usual way of antenna
development with simulation, as is done mostly today, is a
bad way, as finding of new constructions is prevented by
the many limitations of the simulation programs.
The programs are good at schools to show the students
the behaving of changing parameters, but are not the way
of the inventing engineer.

To find new ways and concepts, one depends on the
profound knowledge, the experience, and the mental force
of the engineer, together with experimenting in the field.
The computer is a very helpful tool in many aspects, but
one may not expect much novelties by "experimenting"
with simulation. At least not, until big improvements are

made to these programs.

It doesn't matter. The net power supplied by the source
is *always* the difference between the forward power
and the incident reflected power *by definition*.

The definition seems to assume that 100% of the
incident reflected power is re-reflected *as if*
a 100% re-reflection condition exists.

I would like to know where the noticable
> benefit of raising an antenna above the ground actually takes place
> and where is the maximum benefit.
>
> I know that the higher the better, but rather than that kind of
> benefit, I am wondering from a ground standpoint where the benefits
> start and where the point of diminishing returns begins.

Just depends on the band, the path/angle used most of the time, the
ground quality, etc, etc.. Raising it to 40 ft from 12 feet would make
a
noticable difference if you compare all the various types of paths.
IE:
Just the local ground/space wave will be improved a good bit.
As far as the ionosphere, would effect farther off stations more,
than closer in. It's possible for the low antenna to be nearly as
good on a short/medium hops, but DX will be better on the higher
antenna and possibly open/close the band a bit earlier/later.
Ground loss will be lower, but I'm not sure it's worth the cost of
the
cherry picker.. I'd tend to say not, being a cherry picker is usually
not cheap.. Being the current antenna is just a bit less than a 1/4
wave up, it's not in near a bad a shape as say a 80 or 40 antenna
at that height in feet.

The graph at http://www.vk1od.net/lost/RG58sol.gif has not been labelled for presentation, so you will need to make some allowance in reading it.

The case that is plotted is an extreme mismatch, ou you might argue impractical, but it is extreme enought to show the effects clearly on a graph. The x axis is displacement from the load (-ve towards the generator).

The red line is the so called "forward power" (Real(Vf^2/Zo)) that would be indicated by a correctly calibrated sampler like a Bird 43, but correctly calibrated means for the actual Zo, not the nominal 50+j0.

The dashed purple line is the so called "reflected power" (Real(Vr^2/Zo)) under the same conditions.

The power at a point is shown by the cyan line.

The dashed olive line is Real(Vf^2/Zo))-Real(Vf^2/Zo) (so called forward power - reflected power). It is not the same as as the power because it ignores two terms of the power expansion. A Bird 43 callibrated for the actual Zo would lead you to this line.

This is a very detailed RLGC model, and it reveals from the P(x) line that attenuation per unit length is not constant, a result of the loss being higher in the region of a current maximum. Nevertheless, a sampler that responds to Vf or Vr will not expose the true power curve (due to the two missing terms).

I have thought at times of writing an article that explains the effects on a true practical transmission line, and what practical instruments calibrated for 50+j0 would indicate. I doubt that it would have appeal, people like the "reflected power is dissipated in the transmitter and may overheat it" explanation... it is easier to swallow.

The two "missing" terms are the second and third lines in the legend, the
crossproducts in the power equation expansion. In the case where Zo is
purely real, these terms are equal and opposite in phase and cancel out.

The line is stated as a half wave of lossless line, why do you need to
know more about its length?

The load you are looking for isn't there, the line ends in an open
circuit. Sorry for the confusion, I should have been explicit that there
was no load, just o/c.

The misunderstandings will frustrate your analysis, so try again.

Cecil,

Physicists know when power is equal to work and when it represents undissipated flow of energy. No need to keep beating that dead horse.

I must have missed class the day they talked about obviousness. Why is it "obvious" that standing waves cannot exist without coherent traveling waves? Do you believe that traveling waves are somehow more pure or more fundamental than standing waves?

Have you ever tried working out the mathematical details of the wave equation when loaded with a standing wave trial solution? Did it explode or otherwise fail? (Hint, the answer should be "no".)

The question of standing waves or traveling waves is purely one of mathematical convenience. The physical phenomena are identical regardless of your choice. Indeed, this is the point that seems to always trip you. There is no added information from manipulating the form of the equations. That is the sort of thing, if done carelessly, that leads to adding power waves and other nonsense.

If the forward current and reflected current are in phase
at the source, it may indeed become overheated due to an
over-current condition.

But just as likely (with random feedline lengths) is that
the forward voltage and reflected voltage may be in phase
at the source and blow out the finals due to over-voltage
conditions.

The two above events never occur at the same time. Over-
current conditions occur at low voltages. Over-voltage
conditions occur at low currents.

Not all physicists, including one physics professor who
frequents this newsgroup, knows that, Gene. Maybe if you
sent him a private email, you could convince him that what
you say above is true ...

> Why is it "obvious" that standing waves cannot exist without
> coherent traveling waves?

Please draw us a picture of an example where standing
waves exist without a foundation of coherent traveling
waves. Here's a little help from Hecht of "Optics" fame.

(quote)
E(x,t)=2E0t*sin(kx)*cos(wt)

This is the equation for a *standing wave*, as opposed
to a traveling wave. Its profile does not move through
space; it is clearly not of the (traveling wave) form
f(x +/- vt) ...

Let the phasor E1 represent a (traveling) wave to the
left, and E2 a (traveling) wave to the right. ... (The
sum) doesn't rotate at all, and the resultant wave it
represents doesn't progress through space - it's a
standing wave.
(end quote)

Sure is hard to sweep the facts under the transmission
line rug when the EM waves are in empty space, huh?

> Have you ever tried working out the mathematical details of the wave
> equation when loaded with a standing wave trial solution? Did it explode
> or otherwise fail? (Hint, the answer should be "no".)

Of course the answer is "no". Have you ever tried generating
a standing wave in the complete absence of traveling waves
in opposite directions? Exactly how did you do it?

> The question of standing waves or traveling waves is purely one of
> mathematical convenience.

Of course, that is a copout unrelated to reality. I concede
that you can perform miracles within your own mind.

> The physical phenomena are identical regardless of your choice.

This from the man who asserted that standing wave phase is
meaningless (with which I agree). Point is that traveling
wave phase is NOT meaningless. So which is it?

Gene,
there are 12 authors on this thread dealing with a very, very complicated question. All are self perceived experts and after 130 posts they are still in deadlocked positions. The clock is ticking and there has been no white smoke pour out of the chimney
as yet. The fighting is rough since only one can be right so he can rise above the others and where the the others descend into the rable. This question is one of the most serious questions to have faced mankind for eons and it correct determination is so imperitive to the universe and to ham radio. For that reason the debate is being recorded for prosterity so that all who follow can judge what manner of men they are indeed what manner of self perceived experts they are. The winner will be the one that is more elequent more overbearing and more obnoxious than any other in the group such that it may well be not the best scientist to rise to the top but one who is most deviled where others no longer can stay in their presence. This has happened before where we have lost many an experienced antenna person to venture off into other fields to the loss of all antenna enthusiasts. This is a fight to maintain a position or to attain a position as an expert in amateur radio So it is not to be taken lightly as past winners have brought this newsgroup down to the level which we now hold. There is not room for a lot of experts on this group so descisions about who is most obnoxious have to be decided. So stand clear of the garbage that is now flying in all directions and keep your powder dry.Sooner or later one will be bragging that they invented the WWW and then another will claim something else and it is then that real savagery will enter the fray.
The clock is still ticking and still no white smoke comming out of the chimney!

An example comes to mind. Two obscure Australian doctors
advanced the theory that most stomach ulcers were caused
by a bacterial infection. They were mercilessly ridiculed
for many years. Then they won the Nobel Prize.

Cecil, this question that is posed is not to be ridiculed. Putting an
antenna in a attic is one of the most exciting thing to have faced
antenna experts for a few years. Its importance to the advance in
antenna is unrivalled and more than one believes he is worthy of the
nobel prize. Who will it be? I look for the smoke for guidance.

All this consideration of re-reflected, re-re-reflected, re-re-re-re-reflected energy is something that is appropriate to analysing how the steady state is established, and yes I know it takes an infinite time, but it establishes subtantially quite quickly. The transient converges to the steady state.

To find the steady state solution, take a short cut, bypass the transient analysis and jump straight to the converged situation. In the steady state... The complex ratio of Vf to Vr at the load end is entirely determined by the constraints of a transmission line of Zo and the passive load. The complex ratio of Vf to Vr at the line input can be determined from the load end conditions by applying the line transmission formulas with the complex propagation constant. Knowing Vf and Vr at the input of the line and Zo, the complex V/I ratio (the equivalent load) that the loaded line input will enforce can be calculated. The power delivered by the source can be then found by finding the voltage or current it will supply into the equivalent load.

This might seem long winded, but it is a sight easier than solving some thousands of iterations of reflection, re-reflection and so on.

Owen

2017. Four square antenna and Roy

Newsgroup: rec.radio.amateur.antenna
Date: 2007-03-02 04:28:02 UTC
From: art <aunwin@insightbb.com>
Message-ID: <1172809681.985954.262190@v33g2000cwv.googlegroups.com>

Looked up an article on google called Four square antenna experiences
and to my amazement I found that one of Roy's close friends had
claimed
on his behalf that the four square antenna can be attributed to him.
I waited a while for what Roy had to say because certainly was an
achievement,
if true. Roy did not deny or enlargen on the achievement so I started
to dig for myself.
The above article was the first I came across and it precedes Roys
article in the antenna compendium by some thirty years. As expected
Roy still remains silent taking things on the chin in his normal shy
way.How many other things did he invent before the government released
antenna computor programs to the public and yet still stayed quiet? Is
there still a chance for a Nobel prize for other achievements not
declared?.

> How much of the "reflected power" is dissipated in the generator. In
> this case, the generator dissipates less heat than were it terminated
> in 50 ohms.

Ok, the solution:

Lets examine the matched load scenario for a start, the 100V generator with 50 ohms internal resistance and a matched 50 ohm load. The current is 100/(50+50) or 1A, the power in the load is 1^2*50 or 50W, the power dissipated in the source is 1^2*50 or 50W.

No lets look at the scenario with the o/c half wave lossless line attached to the generator. In the steady state, current from the generator is zero, dissipation in the generator is 0^2*50 or 0, voltage at the generator terminals and at the o/c (load end) of the line is 100V. At the o/c load end, the complex reflection coefficient is 1, so Vf=50V, Vr=50V and "reflected power"=50^2/50 or 50W.

But, wait a minute, there is 50W of "reflected power" on the line, the line is matched to the source, and there is zero dissipation in the source, less than when it has a matched load.

Don't take anything above to mean that I represent that a simple linear model is a good representation of a transmitter PA.

This simple example that shows that existence of "reflected power" on a transmission line does not necessarily result in some or all of the "reflected power" being dissipated in the generator.

I will leave it to Cecil to take to confuse this simple example with some photon based complication.

I'm still using netscape 3.01 to read my e-mail... I like the lesser
amount of
clutter vs the bloated new versions of readers. Also, fairly immune to
the
security problems that can plaque MS exploder.
But I'm pretty much a windows user...XP at the moment.. No plans to
get Vista anytime soon.. The main reason I'm stuck to windows is the
flight simulator requires it.
But.. I also like it because all my sound card programs, etc run off
the
same sound config. No swapping around junk like the old DOS days.
My puter is also my TV/Video recorder, etc too these days.. All
windows
based.. I've never once run Linux yet.. They never had any app's that
were interesting to me.. Or at least nothing that wouldn't run on
windows.
Neither it, or Mac runs a decent flight sim.. And like I say, my puter

is
79% airplane... In fact, the flight sim is why I first bought a
computer in
the first place. I never really had much use for one before that.
I'm running a P4 at 3.15 ghz, and to me, it's a dated system... :/
I'm nearing upgrade time again. Course now, it's a duo core, etc,
vs the usual ramp up in clock speed you used to do.. I'm waiting
as long as I can.. Maybe end up with a quad core or whatever..
The longer I wait, the more I get for my $$$..
I also need a lot of drive space since I started recording loads of
video. I have 240 gig's, and it's always full.. I need about 500 gigs
more just to get a little breathing room. My problem is, I'm lazy,
and
I record more movies than I edit and burn to disk.. So they stack up
on me.. Editing and burning gets to be a time consuming chore I don't
really like too much.. Or at least, I can think of better things to
do.

Dare I say that what is needed is that much overworked phrase
"paradigm shift"? It used to be that a "transceiver" was a radical
new thing, because everyone knew that you needed a separate Tx and
Rx. Oddly, with phased arrays, perhaps the transceiver becomes passe.

I think this has actually been the case for decades. I doubt, for
instance, that the KWM-1 was motivated by some massive pentup demand
for an integrated SSB transceiver.
>

This would be true of many things.. the SDR1000 might be an example. A
variety of TAPR kits might be another.

In fact, for HF, you can probably get away with smaller active
antennas for receive. There's no particular reason why the Tx
antennas and the Rx antennas have to be the same, since you're not
typically receiver noise figure limited. There IS a strong signal IM
problem..so maybe active receive antennas aren't the right solution.
But, there's a lot of convenience possible if your receive antennas
are all something like 6 foot whips.
>

You can use nifty things like the 4 quadrant vector multipliers from
Maxim, for instance.

That would be where I would start. Adaptive nulling is a bit weird to
work with as a user, especially if you expect to control it. And, for
hams, they want a bit more control. What would be cool is to have a
3D panoramic display that somehow indicates not only the frequency
spectrum, but the angle of arrival.

I've got most of both halves (steerable Tx array and steerable Rx
array) in pieces, but there's a lot of practical usability and
integration issues. Sure would be nice to have a wealthy patron and
have lots of free time and a big budget to work on it<grin>. I
developed the in-situ calibration algorithms as part of a R&D effort
at JPL, but the resources eventually ran out. Too many projects and
too little time.

Hi Owen,

Is it noteworthy that I found a blistering hot resistor for exactly the conditions you set forth? Was I balanced in my reply to note the alternative did the opposite? Even with my gaff of missing the halfwave description, was the discussion incomplete in noting there being a spectrum of responses?

Given I come to exactly the same analysis, same solution, same conclusion (with more explanation, perhaps in that I do demonstrate the reflected energy is absorbed/dissipated/what-have-you in the source resistor) as your posting timestamped 2033 hours my time - what exactly do I need to try again? Did the intervening 4 hours between this post and the second one of yours find some catharsis?

Could you give me a dope slap instead of a hint about this frustration I seem to be suffering? Like, should I take an aspirin or a syringe of morphine?

Re Chipman, no I don't have Chipman on the shelf. It sounds like I am poorer for that, but there you go. Allmost all of what I have stated here is based on just two things:
- that V/I=Zo for a travelling wave in a transmission line, and that (Vf+Vr)/(If-Ir) at the load end of the line must equal Zload;
- that the voltage or current decays as e^(gamma*x).
Both are explained in probably any transmission line text, but the graphs I created show a picture that, IMHO, is worth the proverbial thousand words. Exploring the shape of the lines is revealing.

For example, you will remember Dr Ace (IIRC) asserting that rho cannot be greater than 1, and supporting that with the challenge to demonstrate rho>1 with a Bird 43. Of course the Bird 43 cannot demonstrate rho>1, it is calibrated for Zo=50+j0 and rho>1 is only possible if Zo has sufficient -ve reactance to create an observable rho>1 on a suitably inductive load. So, at the risk of exciting another debate, rho can be greater than one, but the maths that supports that proposition also explains why you wont observe it on a Bird 43.

Richard, I must admit I didn't read the rest of your post when you stated that you didn't know the line length and requested that info.

I have now read it.

I make the comment that just because the situation exists where the Volts and Current from the source are the same as the Volts and Current into the line (they have to be don't they), that does not imply matching in the Jacobi Maximum Power Transfer Theoram sense.

Hi Jim,

There may be life left in the transceiver to perform what you want
anyway. Just think more power.

I can sense that this discussion is leading back to a separation of
driver from amplifier. You could still use a power divider to feed
the remote amps at the various array locations. Say 10W at 10 active
antennas, each with a 100W rating.

This would preserve investment, and create and alternative to the
Henry market. Hams would have two purchase paths instead of
discarding their introductory base station and opting in for N number
of active arrays driven by a specialty item that looks like their old
rig gathering dust in the corner.

Of course, if you are talking about two or three elements, this shifts
the investment plan (but it still presumes you are willing to abandon
a prior investment). The cost-benefit of this is usually a steep
slope populated only by a few early adopters.

>In fact, for HF, you can probably get away with smaller active
>antennas for receive. There's no particular reason why the Tx
>antennas and the Rx antennas have to be the same, since you're not
>typically receiver noise figure limited.

There's no reason to expect you need a large transmit antenna for
solid state amps either. The native source resistance of a transistor
is quite low, and has to be transformed UP to match 50 Ohms. If you
had a radiation resistance of only several ohms (a very short
radiator) all you have to pay attention to is cutting Ohmic loss and
providing flexible inductance. Unfortunately, this may be a
performance killer - but if you are demanding multiband performance,
you will have to answer for this for any size array element.

>There IS a strong signal IM
>problem..so maybe active receive antennas aren't the right solution.

The same transceiver that survives IM would still handle it from
several phase active array elements. As you can see, redesigning a

new driver eventually leads you back to the gear you have. If you now demand a separate receiver, separate driver, and separate active array antennas, costs rise faster by the number of connections.

>Adaptive nulling is a bit weird to
>work with as a user, especially if you expect to control it. And, for
>hams, they want a bit more control.

Programmable oscillators that shift immediately and start at any point in the cycle (absolute phase AND frequency control) would be miles further down the road.

These devices are NOT synthesizers NOR linear multipliers. They are variable frequency look-up tables driving a DAC. You send the chip a command of the frequency you want, and the phase angle; send the "go" command, and the oscillator shifts from its existing frequency and phase immediately to the new one (immediately being within one table cell lookup).

When I looked into these 10 years ago, they (driver/DAC combination) operated from the KHz up to about 16MHz and cost less than one XTAL ordered to a single frequency. You still have the elemental clock osc XTAL for processor and driver, but those litter the world for pennies.

Using this kind of technology is about the only reason I would trash my current rigs and go for a custom driver (but it would have to inhabit each array antenna's amp and thus render it a complete transmitter. This would in turn cast all the features (like SSB generation) into each of those elements. The unit cost of this would climb because of feature creep, not component pricing.

>What would be cool is to have a
>3D panoramic display that somehow indicates not only the frequency
>spectrum, but the angle of arrival.

This again, argues for small adaptive antennas. Now you need them in layers.

I was responding to your words:

"I will at this point re quote Chipman to roughly this scenario (being
more general, he didn't specify the reflection).

"At the signal source end of the line ... none of the power
reflected by the terminal load impedance is re-reflected on
returning to the input end of the line."
The ellipsis reveals that the source Z matches the line Z."

I disagree that the conditions that exist in the steady state at the
source end of the line imply in the general case, matching in the Jacobi
Maximum Power Transfer Theoram sense.

> in the patent disclosure.

No. A patent must disclose enough of the method so that someone
"versed in the art" of programing could reproduce it. That's pretty
vague. I might be able to look at the patent and reproduce or better
the process easily, while you look at it and scratch your head. Or vice
versa.

Obviously the more complete a patent application is and the simpler it
is to understand, the more likely it is to be granted and the easier it
will be to explain to a jury in an infringment case. It does not
need to be simple or easy to understand and most are not.

Then as you alluded to later in your comments, there is the whole problem
of implementation. Without a lot of effort, a home computer version of
most scientific programs will produce meaningless results due to
lack of precision.

Experienced scientific and engineering programers know this and compensate.
"Teach yourself Visual whatever in a week" programmers don't.

The biggest problem with visual whatever programmers is they tend to
be seduced by the flashy interface and ignore the substance under it.

Caveat Emptor.

As an experienced scientific / engineering software developer, I suggest that much the same issues exist in a conventional 3GL language as in the "Visual xxx" environment. Good software doesn't just happen, it takes (aside of the relatively trivial task of writing the functional elements), huge effort in dealing with exceptions, and testing, testing, testing.

If you dig deep into the source of Fortran programs, you will often find the heritage of small memory and slow processors in days gone by, where implementers used COMMON for variables to reduce memory use, and used COMMON for passing parameters to avoid the overhead of parameter passing function calls. This practice was, IMHO, the greatest risk to accuracy in such programs, and the area that demanded the greatest attention to design and documentation. The public NEC2 code uses COMMON, and the last bug that I demonstrated in a C port of the code was related to messed up parameter passing in COMMON.

So, the old 3GL world wasn't that good anyway!

Good Morning Alain,

You did not say if your interests lie in DX Or Local on 160M? But for
general 160-10m uses it will be hard to beat the big loop. I had one up
for many years 540 feet around , but feed it with open wire and a good
balanced tuner. On 160m it's not that good for DX but I worked some
anyway. put it up horizontal and on all bands from 80 to 10 meters
you'll have a pretty good Dx antenna. Not as good as a beam but for
general overall use. If Dx is you main interest on 160m Put up a 170'
Inverted L , use an auto tuner at the base , make the vertical section
as high as possible and but alot of radials on on just under the ground.

Those would be my two choices. and Antennas that have worked for me very well over the years. You may want to check out Cebik's wonder sight on the web also. These antennas are easily home brewed. So why pay big buck for the commercial one when you can build them your self.

Cebik's web sights:

Good Morning Alain,

You did not say if your interests lie in DX Or Local on 160M? But for
general 160-10m uses it will be hard to beat the big loop. I had one up
for many years 540 feet around , but feed it with open wire and a good
balanced tuner. On 160m it's not that good for DX but I worked some
anyway. put it up horizontal and on all bands from 80 to 10 meters
you'll have a pretty good Dx antenna. Not as good as a beam but for
general overall use. If Dx is you main interest on 160m Put up a 170'
Inverted L , use an auto tuner at the base , make the vertical section
as high as possible and but alot of radials on on just under the ground.

Those would be my two choices. and Antennas that have worked for me very well over the years. You may want to check out Cebik's wonder sight on the web also. These antennas are easily home brewed. So why pay big buck for the commercial one when you can build them your self.

Cebik's web sights:

2034. What Type of 2M mobile antenna is this?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-03-02 12:20:38 UTC
From: Kevin Hastings <myfamilydotcom@hotmail.com>
Message-ID: <qEUFh.3463$PV3.42848@ursa-nb00s0.nbnet.nb.ca>
Source record: 45198

I just bought a trunk-mount 2M antenna from a SK's widow, and am not sure what type it is, though it seems to work really well. It is a 17" whip on an NMO base, with a quarter-inch stainless steel "'tube" around the whip starting about 4" from the top, and extending downwards 6" or so. At the base of the stainless tube, there's a plastic insert to keep the bottom edge of the tube from touching the whip. A set-screw on the tube's top edge allows it to slide up and down the whip for adjustment.

Works great at 2M but I have no 440 rig to test it so I don't know if it's a dual band antenna or not.

Doesn't look very old, but don't see anything like it on the web's antenna dealers.

Anybody know what model and what the theory of operation is for this one?

Thanks,

Kevin VE9XYZ

A Poynting vector is watts/square angle [watts/degree^2]. It is not being dissipated in free space. It is Diverging [vector relationship]. How do the physics type adjust their definition to include the Poynting Vector?

I'll sit back and read the follow up posts for the next few weeks :-)

> analysis and jump straight to the converged situation.

That certainly works but in the process, many people
have ignored and/or forgotten the total energy content
of a transmission line with reflections is greater
than the net energy being transferred to the load.

A one microsecond long transmission line transferring
100 watts to a matched load (Pfor=100w, Pref=0w)
contains 100 microjoules of energy during steady-state.

A one microsecond long transmission line transferring
100 watts to a mismatched load (Pfor=200w, Pref=100w)
contains 300 microjoules of energy during steady-state.

The transmission line always contains exactly the right
amount of energy to support the forward and reflected
waves. The most logical conclusion is that forward and
reflected waves continue to exist during steady-state
and those EM waves cannot stand still.

Forward and reflected waves during steady-state are
the building blocks of the standing wave which couldn't
exist without them. Forward and reflected waves contain
energy levels which can be easily calculated. The extra
energy, more than the matched flat case, is what causes
the extra losses due to SWR.

No photons necessary, Owen. You are using a Thevenin
equivalent source. Paraphrasing Ramo et.al of "Fields
and Waves ..." fame: No valid conclusions can be
automatically drawn from the calculation of power
dissipation inside a Thevenin equivalent source.
(Sorry, I don't have the book with me for the exact
quote.)

For a lot of real-world sources, double the voltage
with zero current output would be very bad news.

You apparently still cling to the mistaken notion that
standing waves can exist without their forward and
reflected wave building blocks. It is the standing
wave equation that is the math construct that only
exists in the human mind. EM waves cannot stand still.
They must necessarily move at the speed of light.
Anything else violates the principles of relativity.

> I don't know Prof. Hecht, but I am confident he

If I see Prof. Hecht, I will be sure to tell him that
you are engaging in mind-fornication with him. :-)

All you have to do to prove that you are right and I
am wrong is to provide an example of an independent
standing wave existing without the underlying forward
and reverse traveling wave components. If you can do
that, as you imply, you will also prove Einstein's
relativity to be wrong. That might be worth a Nobel
Prize.

It seems that we can draw some conclusions from these
assumptions.

Vf*If*cos(0) = forward joules/sec

Vr*Ir*cos(0) = reflected joules/sec

The forward and reflected energy waves actually exist
and are the building blocks of the standing wave.

Vf and Vr are phasors and therefore subject to
superposition and interference.

The bottom line should be is EZNEC accurate? Has the programming been
held within the confines provided by the original provider'
the U.S. government. Who overseas the content of this so called
program. If it has a patent then all would or should be revealed
in the patent disclosure. Has anybody taken this for his own use for
the advancement of science which is the reason for patents?
Has anybody upgraded the assigned patent for the sake of science
or has something not been disclosed to prevent true examination
and as such invalidates the patent? Does the government have the
option of review of all algorithms or are they in the same position
the country is with voting machines? Basically the purchaser is really
in the position of caveat emptor especially since all programs provide
different results!
Art

Art,
wouldn't it be better if you picked knitting or bird watching?

You would not have to deal with all of us morons and overseas governments
that don't get your brilliance.

Not everything about light (or EM waves) travels at the speed of light.

Standing waves are simply the RF equivalent of stationary optical
interference fringes.

From: Teri Buck <k4ia@verizon.net>
Message-ID: <44XFh.4$ml6.3@trndny08>
Source record: 45213

I am using a multi-switch to change radios and antennas. One of those MFJ 1700Bs. I get different SWR readings depending upon where I place the bridge in the tangle of wires that go into and out of the switch. If I take the switch out of the equation I get very low SWR. With it in I get 2.5:1.

All of the coax has a common ground so the OCF windom also shares a common ground with the coax going up to the beam and all the radios. All grounds are starred at the back of the antenna tuner and run to earth.
I am wondering - does the common connection mean the coax shield to the beam is becoming a part of the OCF windom antenna and vice-versa?

Would it therefore be adviseable to put current chokes on all the ins and outs of the switch? Other comments?

Based upon your description you can bet the farm you've got common
mode problems. Off center fed dipoles (that's what you have - its not
a windom) are notorious for that problem.

You'll need to install some good common mode chokes (high choking
impedance). For an OFCD you'll need two or more on the coax feed
line. I would start with one at the antenna feed point and another
where the coax enters the shack.

Ian White GM3SEK wrote:
> Not everything about light (or EM waves) travels at the speed of light.

All EM waves (photons) travel at the speed of light.
Anything else would violate the principles of relativity.
Any detection of light results in the dissipation
(absorption) of the associated photons.

> Standing waves are simply the RF equivalent of stationary optical
> interference fringes.

That they appear to stand still is just an illusion.
Photons are continuously traveling at the speed of
light to get to your eyes where they are dissipated.
When you see an interference ring that appears to
stand still, you are actually receiving speed-of-
light photons into your eyes. (If the interference rings
were truly stationary, you wouldn't be able to see them.)

If the interference fringes are being absorbed, photons
are being dissipated. If the interference fringes are
being scattered, the photons are moving at the speed
of light. The photons either disappear or they travel
at the speed of light.

The photons in a transmission line cannot stand still.
Standing waves are caused by superposition and
interference between separate and distinct forward
and reflected energy waves. And the photons in the
standing wave are NOT standing still.

Consider two coherent nearly co-linear beams of light.
There are bright points of constructive interference
and dark points of destructive interference but the
interference has no effect on the two waves which
emerge from the superposition unaffected and continue
on their merry way. Those waves never slow down from
their speed-of-light velocity. The "stationary" bright
and dark points are an illusion.

At every point, photons are either being dissipated
or are traveling at the speed of light (including VF
of course). Nothing else is possible.

Dave,

Physicists are basically reasonable, but clever, folks. ;-) They define power as the time rate at which work is done, OR, the time rate at which energy is transferred. With some imagination applied to the context, the definitions converge. In the case of the Poynting vector, convergence (of the definitions) would require dealing with the ultimate destination of the flowing energy. Might be troublesome in infinite space, but on earth, all of the energy ultimately produces power.

The problem seems to be the careless use of "power flow" which, if not meaningless, I find impossible to conceptualize. The flow of the flow of energy? Sort of like common usage of "current flow", which is also the flow of a flow.

2054. Is it possible to estimate any losses due to an unmatched antenna?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-03-02 15:40:48 UTC
From: MRW <mr.whatever@gmail.com>
Message-ID: <1172850043.053869.294430@30g2000cwc.googlegroups.com>
Source record: 45218

Good morning!

I would like to request some additional info regarding the following matter.

Is there a way to approximate the antenna factor loss (in dB/m) for an x-length (in inches ... maybe 26 inches) regular telescoping, monopole antenna that will be subjected to frequencies between 88-108MHz (FM band) at a height between 2ft to 15ft from the ground?

Here's the scenario. A 50-ohm receiver will be used. A cable with an insertion loss of 1.5dB will also be used. The receiver has sensitivity levels as low as -5 dBuV. The lowest received signal that we want to measure is 100uV/m.

I am concerned that if an unmatched monopole antenna is used in this system, then it is possible that very low level signals will not be measured. I'm trying to estimate the lowest amount of signal the receiver will be able to pickup using this setup.

I have the following relationship:

dB(uV/m) = dBuV + Antenna Factor (dB/m) + cable loss (dB)

So, I get:

dBuV = 40 dB(uV/m) - Antenna Factor (dB/m) - 1.5 dB(cable loss)

Now, if only I can estimate the antenna factor, then it would give me an idea whether or not the resulting dBuV level is still higher than -5 dBuV.

I was told that there may be a way to estimate the antenna impedance assuming certain conditions. I was hoping to find some reference for this subject, and just assume how much of the signal is lost due to the antenna impedance and 50-ohm receiver impedance mismatch. I have seen some nomograph for VSWR, so I figured if I can find the estimated antenna impedance at the given conditions, then I can calculate reflection coefficient and relate that to VSWR and then to the nomograph to get my antenna factor value.

What do you experienced ones think? Thanks!

Cecil, W5DXP wroote:
"What is the dissipation in the generator using a Norton source?"

According to page 76 of Terman`s 1955 opus:
"Alternatively, a load impedance may be matched to a source of power in such a way as to make the power delivered to the load a maximum (the available power of the power source). This is accomplished by making the load impedance the conjugate of the generator impedance as defined by Thevenin`s theorem."

On page 75 Terman labels a Norton diagram: "Equivalent Arrangement".

Equivalence means the open-circuit voltage and short-circuit current are the same whichever diagram represents the power source.

The power dissipated in the source under matched conditions depends not on the diagramatic representation, but upon how much of the internal resistance of the source behaves as a resistor does, and how much is "dissipationless resistance". It`s real, but makes no heat. If it were fictional, final amplifiers would be limited to 50% efficiency. We all know many R-F amplifiers have discontinuous input power which allows efficiencies much in excess of 50%.

Best regards, Richard Harrison. KB5WZI

That is a simple question for an engineer! You invest in a antenna
computor program that gives you the answer that you expect
and move on to the next problem. How would you solve it Chuck?

Hi Owen,

This is still oblique. Are you speaking of the conditions you created
(for either instance in this thread)? Or that Chipman created to
illustrate his figure? Or through a loose reference to me? Or
perhaps it is compounded in the missing preceding comma for a
parenthetical "in the general case?"

If the last serves, and to the point of obliquity, when did the JMPTT
show up and who are you disagreeing with?

Skip the math and simply build a matched antenna. If you can do the
whip part, do it again below it and choke the line leading to the two
elements. (Google "vertical dipole." If your signal is horizontally
polarized, substitute "horizontal dipole.")

When living in a residential area, as I do, canceling or reducing local qrm
and man made noise is your first interest!
Using an array is may be the only way to go. Either by using analog means
(phasers) or using digital signal processing. In DSP a lot more is possible.

I use an array of 2 small active loop antennas.
The two phase coherent receivers are made using the front-ends of two
Elecraft K2's and a Delta 44 soundcard in the PC. The software makes
the rest of the dual (SDR) receiver. No expensive hardware needed.
See: http://www.pa0sim.nl/Software.htm
(one of the windows shows the phase difference (TDOA), which helps
eg. selecting the correct phase for the phaser)

Even two antennas can be very effective against local qrm and even non
local qrm. I sure would like to try four antennas HI. It is easy to scale it
to four antennas/receivers, but I still have my qrl .....

What is this "we" business? That is your conclusion

What is the cos(0) term for Cecil? Are you implying that the phase angle of Zo is 0? That isn't true in the general case, it is true ONLY for lossless or distortionless lines.

Simple formulas to determine AF depend on the monopole being short (and
yours isn't) and on a perfect ground plane (you haven't stated).

>
> Here's the scenario. A 50-ohm receiver will be used. A cable with an
> insertion loss of 1.5dB will also be used. The receiver has
> sensitivity levels as low as -5 dBuV. The lowest received signal that
> we want to measure is 100uV/m.

You would be best served by converting your minimum Field Strength to
received power for a nominal antenna system, then determining the minimum
antenna system gain that will achieve your target S/N ratio (not stated
in your data, sort of implied in your sensitivity spec, but check /
adjust it).

With a antenna *system* gain of 0dBi, at 108MHz with FS 100uV/m
(40dBuV/m), the 50 ohm receiver voltage is 29.1 dBuV. The receiver
voltage will 30.9 dBuV for the same situation at 88MHz.

From the above, the Antenna Factor for a 0dBi gain at 108MHz is 40-29.1=
10.9dB/m, and yes, it is frequency dependent.

Antennas aren't often specified by Antenna Factor, gain is more common.

Antenna system means all components upstream of the receiver.

Here is an example of the workup of Antenna Factor for a small square
untuned loop for field strength measurement:
http://www.vk1od.net/SmallUntunedSquareLoop/index.htm .

Is this really what you wanted to do, but for a short monopole (which of
course needs a different approach)?

This probably the most practical thing.. and in fact what I'm working on prototyping. The challenge is in the amplifiers (although the recent FCC ruling doing away with the anti-CB amplifier rules will help)

Most inexpensive amplifiers do not have "well behaved" properties at RF (i.e. they change all their parameters as they heat up).. this makes dealing with phasing and mutual coupling a bit challenging If the output Z changes, then the network matching it to the element needs to change..if the gain and phase through the amp changes, then the drive needs to be adjusted.

Fortunately, the problems are solvable, at least in a theoretical sense.

Yes.. this is exactly the growth path I would envision.

Indeed, yes.. fortunately, you already need to have an adjustable impedance transformer (because the feed point Zs change with frequency/ steering), and even more fortunately, you don't need a broadband match.. All you need is a few kHz, so a single L and C might do it, "good enough".

But it turns out that you want a different kind of phasing for receive
than for transmit (not only a different pattern, but it turns out
you'd like to do it a different way... null formation being one
reason).. that pushes you away from a simple adjustable LC phasing
network for the receive array. For receive, you'd also like it fast
(and, potentially, multiple beams at once).

That's available now.. it's a DDS. And you can buy a radio off the
shelf that has these capabilities (the FlexRadio SDR1000), although,
there are a couple difficulties with the flex (for one, they didn't
bring the sync input to the DDS out to the connector). You can buy a
eval board from Analog Devices for <$200.
>
> ordered to a single frequency. You still have the elemental clock osc
> XTAL for processor and driver, but those litter the world for pennies.

Interestingly, in a very much higher budget arena (deep space comms
and ranging), they're also doing this. Until recently, you had to
special order the crystal for your spacecraft radio (with 18+ month
lead time!!), so if you had a channel reassignment, it was a real
problem. (One of the Mars Rovers and the Mars Reconnaissance Orbiter
are on the same channel.. wasn't supposed to be a problem because the
rover was not planned to survive long enough)

Kind of depends where you divide up the building blocks. The raw
exciter cost (DDS plus mod plus D/A converter for modulation) is quite

low.

Then what you do is add a time varying field to a static field and add
something like " during a period of time " to Gausses law.
What on earth is your problem? Show a bit of inititive !

>
> How do you interpret a non-zero Poynting vector determined by static E-
> and H- fields?

What the Poynting vector actually tells us is that the flux into any closed volume is equal to the rate of storage of energy within the volume. Since a static field has no flux into any closed volume the poynting vector tells us that no storage or dissipation of energy is taking place, ie it tells us nothing and is therefore of no use in this situation.

In non-static fields it does mean something, but even here it may not completely describe the energy flow. The Poynting Vector is just one of an infinite number of way of describing energy flow. It is a convenient and mathematically simple one, but not a complete solution. For instance an alternative one is the Slepian Vector which is mathematically more cumbersome but does include the static case.

If you are interested in a design for yourself, and maybe a production
run of a few hundred, then look to the HF/10M/6M/2M surplus repeater
market from Motorola and RCA designs of the 70s and 80s. Dirt cheap
decks with enough elbow room to make mods.

OK, Analog Devices is a star performer. I built a tube version of this DDS back in '68 when it was called a coherent detector (could have been called many names depending on where you developed the audio output).

However, this is NOT what I was referring to, as that is distinctly different. This is a software controlled oscillator whose frequency and phase is immediately settable (within on clock, this is in the nanosecondS range). If you need to phase each array element independently to phase steer the combined system (also to take care of phase matching through mutual coupling), the software solution spring immediately to the front for a solution.

However, as I pointed out, it means N individual drivers following those oscillators so that each can be phase controlled for the system combination. The downside finds our current investment sitting in the corner again, and our investing more design effort into SSB generation, and hence, feature creep.

The software oscillator I described in the previous post would solve that for the same cost as the custom XTAL.

If you are looking for a design and a market, I cannot think for the life of me why that hasn't happened yet.

To which I got no answers in stereo.

Some may sense frustration to which I once asked how much relief I
would need. Having already long anticipated a non-response (score
100% for accuracy in modeling); others may want to fumble rhetorically
with equally uninformed responses. In anticipation of that I provide
a multiple choice. Richard needs to take:
1. An aspirin;
2. A syringe of morphine;
3. Both of the above;
4. 50 Ohms of dissipation.
5. All of the above, except 3.
6. ____________

Now take that number, and divide it by the Sarcasm co-efficient.

Plot this on a graph and draw an asymptote. You now have a diagram
for a Gaussian Bundle. Find the Pointing Vector for this (it points
to the same answer you picked in the multiple choice) to verify the
authenticity of your newsreader's software design. ;-)

I think the Poynting vector can be calculated even when the E and H
fields are static. Of course, doing so would violate Poynting's
assumptions and thus be meaningless. But if one didn't know in advance
that an arbitrary closed surface contained static sources, and he found
the Poynting vector, S, for some small area, he could well get a

non-zero answer. Of course, the integral of S over the entire surface
would always be zero in the case of static sources.

To be applicable, the Poynting theorem requires that the E and H fields
arise from a single source, satisfying Maxwell's first two equations.
But that information may not be known in advance.

73,

Chuck

My understanding is somewhat different (and quite possibly in error).
You can calculate a non-zero Poynting vector and it will not always tell
you that no storage or dissipation of energy is taking place. Assuming
you do not already know the source of fields inside a closed surface,
you can be misled by the Poynting vector. You need an additional step in
that case: i.e., integrating S over the entire surface. That will
produce a value of zero in the case of static fields.

Chuck,
I believe you would be much better off choosing Gausses law for
statics and adding a time element to the written law itself thus
providing all three cartesian coodinates reguired for the law.
I suppose one could say it is not Gaussian law anymore but
mathematically it fits quite well. This is the basis for Gaussian
antenna arrays for which I have submitted for consideration from the
patent office. As yet I have not heard any comment that invalidates
this concept other than it can't be done from psuedo experts and
frankly I feel that the addition speaks for itself.
Regards
Art

> source?

The existence of cases that show that dissipation in the source does not necessarily increase due to VSWR on the transmission line does not support the assertion that "VSWR causes reflected power that is dissipated in the source". One sound case is enough to disprove the generality.

Sure, transforming the source to a Norton equivalent would produce an answer, and in this case a different answer for what happens inside the generator. That Norton equivalent source with half wave s/c line will also produce zero dissipation in the source.

Cecil, it appears your motive is to create confusion to divert attention from the cases that are inconsistent with the assertion that "VSWR causes reflected power that is dissipated in the source".

I have no difficulty with the statement "a transmitter is usually specified to work over a limited range of load impedances (often specified as a maximum VSWR at the transmitter terminals), the user should expect it works properly over that range and should understand that operation outside of that range may expose it to voltages or currents (consequent heat), that may cause permanent damage". This advice can be given to a six hour ham without telling them any lies, but imparting the knowledge that they need to operate safely.

The explanation expressed / supported by some here that "we use ATUs to cause total re-reflection of power "reflected" from the antenna so protecting the PA" is a nonsense explanation of how the ATU protects the PA from the effects of a poor load.

Owen

Art Unwin wrote:
"I refer you to the thread I initiated on gaussian antennas where Roy was the first to respond."

My dictionary says:
"Gauss`s theorem----The summation of the normal component of the electric displacement over any closed surface is equal to the electric charge within the surface."

James Clerk Maxwell studied the work of others such as Ampere and Gauss to develop his equations defining the relationships between fields, charges, and currents. Maxwell found that dislacement current should produce radiation the same as conduction current. So he made a correction to Ampere`s Circuital Law.

Art is right. Discovery is a continuous process. Maxwell`s equations have now been adjusted for curved space and time.

But, I`ve searched in vain for "gaussian antennas". If Art has an invention, maybe he will explain.

Best regards, Richard Harrison, KB5WZI

We sometimes assume lossless lines for the sake of discussion
which is often a close enough approximation to real-world
lines. We don't have our books with us but seems we remember
that the Z0 phase angle for common Z0 lines is about 1-2
degrees.

> reflected power that is dissipated in the source".

Appearances can be deceiving. My motive is to uncover facts
and I agree with virtually everything you have said.

My personal opinion is that from 0% to 100% of reflected
power can be dissipated in the source depending upon the
relative phase of the incident reflected wave and the
configuration of the source. It can be argued that if the
source sees an infinite or zero impedance, then all of the
source power is reflected at the source output. This, of
course, would be a same-cycle reflection, something that
also occurs at the mismatched load.

By convention, any power same-cycle reflected at the source
output was never generated to start with - one of the original
copouts.

Since the great majority of amateur transmitters are
looking into a Z0-match resulting in total destructive
interference in the direction of the source, IMO, this
subject is pretty much moot. That's why I poke fun at it.

All one has to do to calculate the reflected power
dissipated in the source is to understand the constructive
and destructive interference occurring at the source
output terminal. This is easier said than done.

>The ellipsis reveals that the source Z matches the line Z."
>

The confusion arises out of Richard's misleading quotation, which is out of context and includes an inaccurate final sentence ("The ellipsis reveals...") added by Richard himself.

The context in Chipman's book is specifically about the scale of "reflection loss" as found alongside a Smith chart. Reflection loss is the power delivered into a mismatched (reflecting) load impedance, relative to the power that would have been delivered into a matched (non-reflecting) load.

Chipman points out that "The concept is directly applicable only to transmission-line circuits of the form shown in Fig 9-26, in which the source impedance is equal to the characteristic impedance of the line."

In more detailed analysis, he explains why the definition of reflection loss only holds good if there is no further re-reflection at the source, so the "reflection loss" scale on the Smith chart can only be used in cases where the source impedance Zs is equal to Zo of the line.

Richard's comment that "The ellipsis reveals that the source Z matches the line Z" is misleading, for that isn't at all what Chipman was saying. Chipman makes it perfectly clear that this section is dealing

with a special case, which only applies if Zs has deliberately been made equal to Zo. Most of the rest of the book deals with the more general case where Zs is NOT necessarily equal to Zo.

However, that special case often does apply to signal generators and similar test equipment. If the RF output comes through an attenuator that has a design impedance of Zo, and if the attenuation is large enough, this creates a good approximation to a source of impedance Zo. Then the reflection loss concept becomes valid.

When I retired fro G.E. as an engineer it was because I had a heart attack,the culmination of which was that I had lost my memory skills among other things. I turned to antennas because it allowed me to fool araound without achieving anything.. I found that I has also lost my reading skills in that I could read one line and by the time I got to the next line I had forgotten everything. So when I was not out in the yard I purchased loads of fields and waves and physics books not because I understood what I was reading but at least they were different books Physical troubles still followed me included a ruptered gall bladder that was taken out the hard way. Later my heart went again and I had open heart surgury
during which I got an infection which took nearly a year to get over. Later after having an implant for my heart that to got infectious but I went out of town first on the antenna
examination and went into hospital as soon as I got back as the pocket had completely
opened up and puss was dripping so I was lucky that I got back in time tho the antenna was so important to me because of the years that had passed.
One of the reasons I came across all this was I was unfettered by my previous teachings
and basically was back to childhood in learning to keep myself alive which ment a lot of daydreaming which I am still doing because I busted my knee on ice after clearing 60 foot of driveway of two lotsw of dumped snow. This dreaming and reading of the same material and different books over and over again took me down paths that were not the beaten paths that one follows in colledge and thus I ventured way off track on lots of things and questioined what I read consistently to be sure I had got it right plus I could remember it.
How I got to the Gauss point I do not know or why except I know I did a lot of drawing.
I have not stated all that I found about what I call Gaussian antennas except to say there is so much more to be learned and surprises to savor. Fortunately I have a good family that helped me with the depression and the pits that often came plus I have a son who isw a computor consultant for San Diego University who has a lot of successes of his own including helping the red cross at New orleans as well as the author of the Biology Workbench which brought in more than a million dollars and where he was always on call to fix things on the computor when my memory took various different turns.
So with the above it may help you to unde4rstand how I sorted out the fishingpole store and the present antenna story but frankly I know I can never represent myself as an engineer anymore but my interest now is purely to stay alive without any more set backs

Hi Ian,

I have restrained the afterburners until 1200 GMT (seeing as you are undoubtedly in bed) so that you can fully read the entire side thread and discover the complete botch you've made in an attempt to weakly persuade the group that a transmitter could never absorb the energy of a reflected wave.

That was your point for this chain of accusation, wasn't it, or were the accusations a solitary pleasure? (I hope you opt for the first, or other explanation.) I don't expect any apologies so that I can enjoy a dish that is best eaten cold (re-heated actually). ;-)

Richard, I did find a number of references to Gaussian antennas on the
web. i.e.
http://www.flann.com/Products_Home/Antennas/Gaussian/gaussian.html
The only conclusion I can make is that the radiation pattern appears
to be a Gaussian curve. This does not seem to be related to Art's
postings.

It appears that Art must be on my blocked senders list, since I found
responses to one of my earlier posts on Google's archives.
I could not entirely follow his rational, but
one of his complaints was "I did not provide the polarity
of the patterns". If he is interested I can provide all these data
from the NEC output file; also the NEC code. I would first
need to know his e-mail address in order to remove it from my blocked
senders list.

Regards.

Hi, i am a new ham and i just purchased an old VP commodore station wagon. I was wondering what the best method would be mounting antennas on this vehicle. It has a non metallic roof rack so i was thinking of getting a metal plate across the roof rack and mounting the antennas on that. So i was thinking:

1. How to electrically connect the plate to the vehicle
2. What order/sizes to have the antennas in. (Largest at back, smallest at front? It shouldn't really matter, depending on directionality requirements.)
3. The best method of routing the coax from inside car to roof plate, i don't want to cut holes in the roof if not needed but probably will have to.

Please feel free to suggest any methods used or ideas. I will probably have antennas for the following but not sure what the "best" antennas are for each radio, once again, feel free to suggest antennas to use...

UHF CB
2 Metres
70cms
Scanner

I could use a dual band for the 2/70 antenna but i want a good one. I am in VK land so anything not sold in VK i won't buy.

Thanks for looking...

I'm running around like a three peckered lizard.. I've been
constantly
dealing with medical people, as my mother has had two strokes,
and has been in a nursing facility. Just this week I had to
fire her HMO, and get her back on regular medicare.. What a farce...
This was in order to get her back in the hospital for a needed
checkout. Finally got her in yesterday. I've got to run to her
nursing home to pick up clothes, and then take them over to
the hospital. Then I've got to see if the people that just sold me
a car have my license plates yet. I bet they flake out, and make
me wait til monday.. They expire 12 am monday morning.
I have to drive to Oklahoma tonight to look at two properties. I'll
be leaving about 10 pm tonight, drive to Eufaula OK, which
I'll get there about 6 am. Look at that property which is near
the lake. Then I've got to leave there, and drive to just south
of Paris TX, and look at another property there. Then drive
back home.. I won't be sleeping again until tomorrow night..
Then I gotta decide which of the two properties I want..
I'm trading 10 acres I just bought for one of those two most
likely.. They are both 5 acres, but better roads, quality, etc..
I'm kinda leaning to the one on the lake, but will see...
It would be nice to be able to walk to the lake from the
property.. I'll have an easement to the lake too..
Needless to say, antenna chitter chatter is kinda
low on my priorities right now.. Well, gotta go water
myself down in the de-smell chamber, and hit the trail..
No radio chatter in that car...It's a fairly new corolla,
and it's so purty I'm having trouble bringing myself to
drill holes in it. That thing sips the gas.. Just what I
need for these quicky 900 mile road trips..

Gary,

Since the large metal plate you are thinking of putting on your roof is only acting as a ground-plane for VHF/UHF antennas, I see no need to have it electrically connected to the roof... though you may end up doing so simply from whatever mounting techniques you decide to use.

Also, one consideration might be to use half-wave type base loaded antennas, which technically do not require a ground plane.

Thirdly, there are vendors, such as Antenna Specialists, who make a metal foil tape for installing on the underside of non-metallic roofs at antenna mounting holes so as to provide a ground plane for the antenna. They're used a lot in ambulances here that have fiber-glass tops.

Food for thought.

I did something like this for my VW Passat. The way I wound up
connecting it was two fold. First, the ends of the rack rails had a
plastic cover over where the bolts holding the rack onto the car body
were. Popped the cover off, removed the nut, put wire with lug under
the nut. Cut small notch in edge of beauty cover to run wire through
and popped it back on.

As far as coax went, I just ran through the rear hatch gasket. Cut a
small slit in the gasket, and carve out a hole big enough for the
coax, install coax, then use gasket glue (or superglue) to repair the
slit.
use small coax, at least for the gasket traversing part. RG-174 is
pretty small (2mm?) and a 10-15cm doesn't have all that much loss.

A friend went to quite a bit more trouble and went through the
existing radio antenna hole. he built a little "collar" that matched
the base of the antenna. There's a fairly large hole through the body
there, but to route the wires you have to pull the headliner off.

BTW, A good body shop or car stereo installation place can remove and
replace interior trim quickly, cheaply, and efficiently. They have
all the right weird shaped tools and the judgement about just how much
you can pry or pull without breaking things.

Especially if you have Sirius or XM radio in VK land, there's probably
folks around who have gotten pretty good at inconspicuously routing
coax from outside the car to inside.

The VP commodore is about 15 years old now.

You haven't stated why you don't want to put holes in the roof. Most people with a car of that age, if it of average value for its age, would put holes in the roof without hesitation.

It is a little difficult to comment on your plate proposal, how big is it, how will you prevent wind noise, vibration, failure etc.

If the plate is not large enough, you really have one antenna with four feedpoints. One could argue that the entire roof of the wagon is only just large enough to accomodate all the antennas you propose.

You could feed coax in between the door and door seals, but it is inconvenient and fraught with problems (cable damage, water ingress etc).

Unless the car is of some special value, I would place holes in the roof, spaced out down the centreline. Get someone experienced to help you find where to cut the holes so that they have room underneath, so you can route the cables down the windscreen pillar, and without dropping a hot piece of metal (eg the donut after holesawing the roof) through the headlining.

There are commercial dual band antennas sold here, but I would skip the MobileOne product. Look at the Diamonds and the like, but they require a proprietary base. Your other antennas will probably go on a vanilla 5/16" brass thread stud base.

If you don't want to put too many holes in the roof, you could place one good 2m/70cm antenna with the base just behing the interior light, and put the other two on Z brackets on the front mudguards.

I was wondering why you need the chook band when you have 2m and 70cm, 2m and 70cm seem like they are half way to CB here, certainly the lingo is strongly CB.

73 or 1004, or whatever they say on air these days.

> >"good enough".
>
> So, this daydream is on one band only?

1 adjustable L, 1 adjustable C.. covers all bands. For ham
applications, you only need to have the match and phase adjust at one
frequency at a time, and over a fairly small bandwidth, so the Q of
the matching circuit can be high. Not like a generic wideband phased
array where you need to have a wideband match, and do something like
true-time-delay processing.

> and phase is immediately settable (within on clock, this is in the
> nanosecondS range).

That is precisly what a DDS does.. It has a phase accumulator where
you can adjust the phase increment per clock. The output of the phase

accumulator goes to a sine lookup table and then to a DAC. A typical
part might have a 48 bit phase accumulator and a 12 bit DAC.

Check out, for instance, the AD9858..

You might not be able to update the phase increment or absolute phase
in a nanosecond, but it's pretty fast (there's some pipeline delay
too.).. I'd say you could clock in a new configuration and have the
new RF appear no more than 100ns later.

If you need to phase each array element
> independently to phase steer the combined system (also to take care of
> phase matching through mutual coupling), the software solution spring
> immediately to the front for a solution.

Well, software for the calculations, but perhaps not for all the RF
processing. You still need to adjust Ls and Cs for the match, unless
you're willing to design a fairly unusual amplifier: ideally, it would
act like a current source with a lot of voltage compliance that can
tolerate a very reactive load.. so you're essentially synthesizing the
L and/or C with an active device.. doable, but not too hot on power
efficiency these days.

> The software oscillator I described in the previous post would solve
> that for the same cost as the custom XTAL.

Well.. not the same cost as a custom rock. The rock may have a long
delivery time, but it's not particularly more expensive than a
standard frequency. The DDS doesn't come for zero power, either, so
you have a tradeoff of more DC power for flexibility (power
consumption is a very big deal in deep space exploration). And, then,
there's also the whole radiation tolerance issue.

>
> If you are looking for a design and a market, I cannot think for the
> life of me why that hasn't happened yet.

Systems like this exist, but not in the ham market. Oddly, it seems
that hams balk at forking out more than $100K for a system that does
all this. The challenge is in getting it in a ham friendly format.
The hardware's not expensive, it's all that software and system
integration. But, 10 years from now, when the early adopters have
cobbled together their systems from bits and pieces, and some of the
concepts become more familiar, I think you'll see someone make the

investment to do the development to create an off the shelf product.
Clearly, there is SOME market for $10K ham widgets or things like
IC7800s and big towers with arrays of SteppIRs wouldn't exist.

All formulas were derived from "real hands-on"
construction/development/experimenting. They will only be correct in
the narrow confines of what has been built before, or closely related
models to these physical antennas upon which the equations/formulas were
derived from.

Duh!

You might have to. I don't think an L tuner is going to have the
flexibility to look into the mutual coupling, as well as the delay, as
well as the match and be scalable to 3D. (May as well dream in
technicolor and surround sound.)

Ever hear of a gyrator?

The problem of solutions off the shelf is that they have been dumbed down to the most generic market.

Consider your suggestion of the HFSP. Looking at the schematics reveals the same old stale Class AB design WITHOUT neutralization. It seems that feedback is an anathema to designers that have to pay the piper called a commodity market. If they built a 20dB amp, and then discarded 10dB of that gain for stability and source resistance control - THEN you would have engineering. The 10dB cast back into the amp loop was called "noise gain" by HW Bode; and this cured so many ills of stability, distortion, noise, dampening, regulation... that it its absence cheats us all of superior performance for the sake of squeeking every dB of slop into the antenna. What would the world be like without that filter deck following the amp? Amplifiers are perfectly capable of delivering a low distortion HF sine wave - if you designed it in, that is.

Early adopters are not being served there.

A solid state inductor/capacitor (AKA Gyrator) is technically a budget buster for the chintz market; but if you design to the mission, then there you are. To invest in digital oscillators, and then short sheet the product with a limp re-hash Amp deck out of the 60s is not going to ignite a new product venture.

This may be a dumb question for some of you, but.....

I understand what a choke does at the feed point (I use an air wound one at my feed point) However, I am having trouble understanding the purpose of one near your rig.

Also what effect happens in the coax between the two chokes?

Thanks
Joe

Maybe somthing like this, but without the rollers. Some of the really cheep
ones just have a metal clasp. Mount them on small plates, or directly if you can.
http://ebay.phlat.com/44/2.JPG

Or maybe a just a piece of spring steel that would ride up on a metal
plate when you shut the sliding door.

Maybe a well placed coil spring, so when you close the door, the door
will go in to be flush with the body, and have the spring contact a clean
plate mounted where you have the most inward movement, which I believe
is near the rear sliding hinge, and down in the foot well. I think this would
make the best connection to ground.

I don't know about your location, but the need for CB can be quite valid, even for a ham, in many places. My location, as numerous others, has a lot of logging activity, and if one is driving on some of our back roads, it is quite helpful to hear where the logging trucks are.... they commonly announce their presence on dangerous parts of these roads. There are many other instances in rural areas where CB can be helpful, too.

I believe you are going to be more concerned with the transmission line loss and the additional loss incurred due to the mismatch if the mismatch is severe.

To obtain a desktop estimate of the VSWR, download W7EL's EZNEC demo version (www.eznec.com) and put in the antenna dimensions, frequency of interest etc. It will calculate the impedance and VSWR for you.

Take those values and go to http://www.vk1od.net/tl/tllc.php and plug in your values along with the cable you plan on using.

You can also pull the ARRL Antenna book and look for the formula to calculate the additional transmission line loss due to a load mismatch.

Hi Joe,

The one near your rig would be opportunistic (on the chance it was
needed). However, as it could satisfy a need then that leads us to
your second question.

The portion of the line beyond the choke at the antenna is still in a
strong field that "could" couple energy into it and reestablish the
common mode currents the choke was there to prevent. If you were to
place a second choke a quarter wave from the first, that would snub
this coupling (and thus the one at the rig, if it were harmonically
related, would also tend to snub common mode current).

I use a 20 foot line section with about 60 ferrite beads distributed
along it to make for a more multiband, or general purpose second
choke.

Harry,

At the risk of reawakening the source end re-reflection noise, this is a receiving application, if the receiver is 50 ohms (as the OP stated) and 50 ohm coax is used to connect to a short monopole over ideal ground, the VSWR on the line is 1:1 (or near enough), and loss is the matched line loss.

The implications of that are that the short monopole, which has a source impedance of very small radiation resistance and loss resistance, and a huge capacitive reactance is loaded by the 50 ohm impedance looking into the coax.

You can relatively easily work out the o/c voltage in the whip as a result of an incident E field (it will be ~E*length/2), but you must estimate the capacitive reactance as it is the main determinant of the voltage divider formed by the antenna source impedance and the 50 ohm load.

>

The impedance from NEC (of any flavour) can be used to workout the voltage divider I mentioned above.

Alternatively, use a variety of NEC where you can excite the antenna with an incident wave and observe the voltage developed on a load inserted in the model. The model described http://www.vk1od.net/SmallUntunedSquareLoop/ssulNEC.htm at does such a thing for a loop, you could do something similar for a short monopole.

My thinking is that a short monopole is less attractive at these frequencies than using a dipole of known gain and impedance, a dipole is convenient (probably more than a short monopole with a large ground plane) and more sensitive (ie lower Antenna Factor).

The formula in this case for the monopole termination loss is 20*log(50/(Zs+50)) and must be factored into the ratio of E field to o/c voltage to get AF.

Yes, i am in rural Southwest Victoria. I am currently running a discone on 2 Metres which is about 5 Metres above ground.
The closest 2 Metre repeater is approx 100Km line of site and has big problems with RX, as such i cannot access it with my current antenna. I have a 20 element yagi on UHF CB with a repeater to the Southeast and us locals use that repeater to communicate as we have for years, and its our local link, still, at this stage. So, we're not all surrounded by repeaters in our back yards in this corner of this state and the terrain isn't all flat either, our town is built on the Glenelg river and fortunantly i live a little higher than the centre of town. We still have non amateur friends on UHF CB and like to keep in touch with them. I pitty those that use UHF CB repeaters in or near cities, usually it's a waste of time talking on them but there are SOME good operators there as well. "in the sticks" we use them for proper conversations instead of kids trying to overpower each other. Maybe thats why you are wondering why i still want UHF CB

Source record: 45130

My entry into HF has been a 10m sleeve dipole, discussed at length here and still a work in progress. (The coax is out of the lower element, so it's just a vertical dipole.) More about that below.

Today, at a local swap meet that features ham gear on the first Saturday, I bought a little tuner for $5.00. It got my puny TS-120 onto 15 meters and I talked to a guy in Pennsylvania. Hot stuff! That was my first QSO outside the local area, not counting IRLP. And this with an antenna that's mounted only 18 inches above the ground.

I tried it on 20 Meters, but that was too much of a stretch. Very high VSWR no matter what. Antenna must get bigger. How to make antenna bigger? Add metal.

I grabbed a three-foot piece of meter lead with alligator clips on both ends. I also grabbed a hank of TV coax and went out to the antenna (in the dark with a flashlight), intending to stretch out the coax and clip it to the end of the lower element of the dipole. I nearly tripped over a retracted aluminum extension ladder laying on the ground. Ah, fate! I immediately clip-lead-connected the ladder to the bottom of the lower element of the dipole and went back inside, taking the unused RG-59 with me.

This time, the tuner had no trouble getting a very low SWR. I tuned around and heard a guy. I called him and he came right back. From Hawaii. He said I had a solid signal, although I'm sure his five-element beam was doing much of the work.

I've heard stories about unusual antennas, including the one about "loading up the bedsprings" but I believe a ladder laying on the ground as part of an antenna is a novelty.

I tried 40 meters and got a good match. I could hear people but nobody came back when I called. Maybe I needed to stretch out the ladder.

Back to the subject of the original dipole. I got a 1:1 balun at the Ham Radio Outlet store in San Diego today after the swap meet. I will try fitting it to the dipole as a possible cure for feedline radiation. Also, I probably shouldn't have the dipole leaning against tree branches for support.

Gary, 100km is a long path to a repeater, so you have to make sure you are doing some things right.

I don't want to be negative about your discone, but they, being very broadband, accentuate IMD problems (so called pager interference) with receivers. If you are in the sticks, that won't be as noticeable as in the city, and it will affect ham gear more than commercial LMR which tend to have better front end selectivity. The other thing about the discone, is it is relatively low gain on tx.

I note that your main problem with the 2m repeater is it hearing you, so you should be trying initially to boost your transmit signal. Perhaps you should look around at one of the commerical high gain 2m or dual band antennas that will give you 3 - 6dB lift depending on the model (in other words to double to quadruple your effective radiated power). Review your feedline situation to see you are not chucking signal away there as well. Another alternative is to build or buy a small yagi, 4 to 6 elements, vertically polarised and fixed on the repeater, but of course it is a bit restrictive for other contacts.

> I have a 20 element yagi on UHF CB with a repeater to the Southeast
> and us locals use that repeater to communicate as we have for years,

Repeaters aren't everything, I think there are 9 or so here for a relatively low ham population, I don't use them, and they aren't very busy except for drive time when they sound a bit like CB.

Have fun, try experimenting with some different antennas, reserve your discone for a radiating dummy load.

Re the Commodore, when I was younger, the deal was that the car owner purchased a slab, invited some competent mates around and after a certain anaesthetic threshold was reached, the holesaw came out and the antenna was installed... just watch that the guy with the holesaw isn't as anaesthetised as a newt!

There you go! 90% of the modeling here is so much narcissistic
puffery in analysis and "science" when almost anything will radiate
(actually everything will radiate). If you want to mark it up to the
other guy's antenna, it all still works.

Glad you could touch the other side of the world (or at least a
quarter of the way there - there's nothing but sea, or Diego Garcia,
half way 'round).

Spread around some more ladders (cheaper than gaussian arrays).

Actually, it need not be that high. Just decoupling an antenna from a
less-than decent ground will improve its gain. The ideal height for a 20m
antenna would be about 8m. Of course if you can put it up at ANY height,
then go for the 100m plus range, but if you can afford the hardware for
that, you can also afford the hardware to stack two beams!

Hello Teri,

It is very likely a common mode problem (as Danny and Richard also
mentioned).

Sometimes the SWR meter is the problem. Check your instrument by
connecting a known mismatched with various length of cable (for
example 75 Ohms resistor in combination with 2 1/8 wave 50 Ohms
cables). This resistor should give a 1.5 reading on the instrument,
irrespective of cable length between resistor and instrument (provided
that cable losses can be neglected).

Other problem (unlikely) can be significant harmonics in the output of
your Final Amplifier.

Best regards,
Wim

You have my sympathy...
You have become infected with an advanced form of the Ham Radio Virus!

You will no longer be able to go to any store without seeing double.
Every thing on the shelves will have its intended purpose and some
"repurpose" involving antennas. Most of the time you will think no one
else considered such matters in the same light.

You will have visions of writing books like "One Hundred Ways to Load
a Ladder" or "Beach Umbrella Stealth Antennas".

Collecting bits and pieces of aluminum will present a storage problem.
One man's junk is another man's antenna parts.

The virus may become dormant from time to time but it will not go
away. There is no cure.

Thank you to everyone who answered my question.

The reason I asked is because I am designing a vertical that can be
ported to a location and setup as a single band vertical for whatever
band is desired at the time. I was wondering if I could raise it
about ten feet or so and use radials as guy wires to get a better
effect than laying it on the ground. I figured I might could get away
with using 4 to six radials and have an improvement.

I am still not sure of the answer, but I think I have figured out that
if I use six radials at ten feet, it will still be better than 6
radials on the ground. Of course, I am wondering if I will be able to
use more than three or four radials at the time.

Thanks again.

Thanks, I get it now. Sometimes I miss the simple things (not seeing the
trees thru the forest)

Now to make things more complicated.....

I use a modified fan dipole for all bands from 10m to 80m so how to figure
out where to place the beads would be pretty hard to figure out. I really do
not favor any frequency on any band.

I do not seem to have any problems with the feed or the antenna but hell I
am all for trying different ideas.

I will be moving soon and starting over with my set-up. So now is a great time to plan everything.

Would placing the beads, 1/4 wave apart, midband for every band, have any benefit?

Also, where is a good place to buy them? I use airwound chokes now but they have there limits along with the added loss of more coax....

Thanks

Hi Myles,

The beads are spread evenly along the length, and I generally use it
to lead away from the choke so that it is in the highest field.

It would certainly add more isolation for all bands. You might want
to focus on connector strain relief.

> Also, where is a good place to buy them? I use airwound chokes now but they
>have there limits along with the added loss of more coax....

Amidon, Fair-rite are two brands that come to mind. There are others
certainly, but having bought and scavenged all that I've ever needed
some 10 - 15 years ago, I wouldn't know just where to purchase (google
can undoubtedly point you in that direction). The harder part is
choosing which formula and form factor. I will leave that to others
to chime in, providing you aren't inundated by theorists.

> the bridge in the tangle of wires that go into and out of the switch.

Teri, some thoughts:

For practical transmission lines and antennas, the VSWR decreases smoothly from load to source, and the rate of decrease depends on the transmission line (one way) loss and is predictable.

For example if the VSWR is 1.5 at a certain point, then at another point closer to the source and where the one way cable loss is 1dB to the first point, the VSWR will be 1.4.

So, if you are truly making VSWR readings without changing the line length, you should expect the readings to decrease towards the generator, but the decrease for practical lines will be quite small. If you observe otherwise (higher or lower) something else is happening.

A well designed switch should not change the VSWR much on the through leg, so measurements either side of it should be similar.

If you are changing line length as well as moving the VSWR meter (just to complicate issues), a likely contiribution is that the outside of the outer conductor is influencing the load seen at the load end of the coax, ie the cable is carrying current on its outer (which is often undesirable).

> If I take the switch out of the equation I get very low SWR. With it
> in I get 2.5:1.

Is this on only one antenna, or are you generalising and oversimplifying things?

In taking the switch out, have you disconnected the cable outer conductors whereas they would have all been bonded at the switch?

What does the switch do with the non-selected antennas, does it ground them? Grounding the end of the feedline to the unused, but mutually coupled antenna may inflence the load presented by the selected antenna.

Have you checked all the components in your "tangle of wires". Are there faulty cables, or loose connectors (especially if you are using UHF connectors).

The answers to these questions might throw light on what is happening and whether choking will fix it.

>
> All of the coax has a common ground so the OCF windom also shares a

Well, you know that the "OCF Windom" (aren't they all off centre fed) depends on a radiating feedline. Perhaps you mean one of the newer designs with coax vertical that are designed to have common mode current on the vertical part, then you try to restrict that current at a point where you decide the coax is to be feedline and not radiator, which is easier said than done.

...

Owen

2130. Windom antennas - down to earth

Newsgroup: rec.radio.amateur.antenna
Date: 2007-03-04 22:07:30 UTC
From: Owen Duffy <none@no.where>
Message-ID: <Xns98EA5CD2ABDF2nonenowhere@61.9.191.5>
Source record: 45144

According to my ARRL Antenna Handbook, the Windom Antenna was described by Loren Windom in QST in 1929.

The design is a horizontal half wave (ie single band) fed by a vertical single wire feedline attached just off centre (~14%). Explanations go that this approximately matches the feedline Zo (which is quite high) with the horizontal wire. It is single wire (ie ultimately unbalanced) feedline and therefore radiates. The Antenna is fed between the source end of the feedline and ground, and the load impedance should be somewhere in the many hundreds of ohms. The feedline carries an appreciable net current.

More recently, the Off Centre Fed (OCF) Dipole design emerged, principally as a multi-band antenna. The OCF Dipole is a horizontal wire with a coaxial feed and coupling transformer (often called a balun) attached offset from the centre of the dipole. The feedpoint excursions at a half wave length and harmonic frequencies are much lower than centre feeding, and may be operated as a multiband antenna with reasonable efficiency, though it probably really needs an ATU at the tx end of the coax. The OCF dipole feedline does have current flowing on the outer of the outer conductor, at least as a result of the assymetric coupling to the dipole legs, and to some extent because the ineffectiveness of practical coupling transformers to isolate the feedline ends from the differing voltages on each dipole leg. The feedline carries an appreciable net current.

Then along came the Carolina Windom, which appears to be a OCF dipole with a proprietary (ie secret, undescribed) coupling transformer, a vertical coax section (feedline and radiator) and a proprietary (remember the meaning) "isolator" located at a given distance along the coax to prevent the current flowing on the outer of the outer of the coax from flowing further towards the transmitter. The isolater would appear to be a ferrite choke and it would introduce a series impedance (reactance and resistance) to current on the coax, so influencing the establishment of the standing wave pattern on the outer of the outer of the coax. You might naively think that this isolator prevents current flowing into the shack, but that is unlikely.

In all these cases, there is an expectation that the feedline carries a net radiating current, and it seems to me, that if you don't want to bring that into the shack, you need to design an appropriate solution.

In the case of the true Windom, it seems the easiest solution is to end the single wire feedline outside the shack and place a matching unit connecting to ground and the single wire feedline at that point, and transforming the load to something suitable to coax or balanced feedline

to the shack.

In the case of the OCF Dipole and the Carolina Windom, shunting the current on the outer of the outer to ground outside the shack is a potential solution. Series chokes might help, but the magnitude of the choking impedance is limited, and their effectiveness could be improved greatly by a low impedance shunt to ground.

Comments?

Owen

PS: In todays paranoid world where rules in many jurisdictions restrict the maximum permitted exposure to electromagnetic radiation, antennas such as these with radiating elements that are close to areas accessible by people are a safety challenge.

Thanks Owen, Yes, i know the discone is low gain, and i have (Shock, Horror) approx 60 ft of rg58 connected to it :>
I have been playing with radio for about 20 years but only just aquired my Ham ticket. I have read the ARRL handbook around 5 times now i would say, cover to cover.

I am modifying an ex CFA "Polar" 163.2 MHz vertical at the moment, there are plans on the net to modify this antenna to 146 meg. For those wanting to view this pdf, google vk3cmc cfa. I am also going to price tubing for a 17 element 2 Metre Yagi and later on one for 70cm. Combined with some RG-213 i think that will be quite fine, another station further away than i am is getting into the repeater with a 6 element. My tower will be going up soon, got a 50ft and 75ft so debating which one to use. 75ft is narrower inner section (3 stage tilt over crank up) so would not hold as much weight and wont take my KR400 inside the top section (too narrow).

I have the discone as a way to get up and running, can use the Mount Gambier repeater with it all the time and that one is around the same distance AND a large hill between it and me.. Most repeaters for us are around 60-100k +. we have members all over the corner of the state and would be stuffed without repeaters, fantastic things!!

Anyway, back to my ex CFA antenna...

Yeah, ouch. Here is the bad news, if the discone VSWR is 1.5:1 (at the antenna) and you have 60' of RG58, you are losing 58% of your transmitter power in the feedline. With RG213 you would lose about 30% and with LDF4-50 you would lose around 11%. The picture is worse with increasing frequency.

Now you can offset the loss of transmitter power with an amplifier or another 4dB of antenna gain, but noise levels should be so low in Casterton that you will not recover the loss of receive performance without an LNA (preamp) at the antenna.

If you want to work some line loss solutions, try http://www.vk1od.net/tl/tllc.php .

Before I you get you carried away with LNAs, the following article might be a bit technical, but it has some summary graphs that might convey the idea: http://www.vk1od.net/gt/index.htm .

Something else to keep in mind, with an FM receiver, a 1dB increase in strength of a noisy weak signal will result in much more than 1dB improvement in Signal/Noise ratio. Improvements to your EIRP have the same effect at the remote receiver.

That is a huge antenna, 17el on 2m! You are talking about a 10m boom. Gee, that will be a challenge horizontally polarised, but a bigger challenge if vertically polarised. Have you thought about two yagis stacked in the H plane, and supported so that you can swing them from horizontal to vertical polarisation?

BTW, if you are interested in DL6WU designs for a long boom yagi, and they are probably a good place for a beginner to start, see http://www.vk1od.net/dl6wu/index.htm .

High towers means longer coax... you might be looking at LDF4-50 sooner
than you think, especially for 70cm and 477MHz.

That should be an intesting project. You will see first hand what is
inside the radome, and understand why poor implementations are prone to
fatigue failure.

Yes, a good article. But Ron doesn't really address the common mode current
issue, and routing common mode current into the shack.

Seems like an excuse to give him a ring, we haven't talked in a while.

Owen

Yes, for that any good page on voltage\current baluns or hybrid baluns
will bring one up to speed. For example, a page which provides more
than you want to know:

I tried a real Windom on 20 meters. Used the ARRL antenna book
formula. Ran a single wire feedline to the random wire terminal of an
old Murch transmatch. Had a 1/4 wave elevated counterpoise attached to
the ground terminal of the tuner. I couldn't match the thing to my
little QRP rig to save my soul. Lots of RF and buzzing sounds.

Ended up turning it into a standard dipole.

I can't stand windoms myself... A poor design overall.. Bout par for
1929
technology..
I compared a dipole to one of those "carolina windoms" one time using
a
A/B switch.. It was ugly.. The dipole thrashed it. The windom setup
had
way too much loss. Mostly in the perverted mess of a feedline/tuner I
suspect.
But.... It doesn't bother me if anyone else wants to use them. IE:
field day,
etc. I like having an unfair advantage... :) All those windoms strung
across
the country on field day just help me get a better score...
Ughhhmm, maybe I should keep my mouth shut...
Yea.. Forget what I said. The windoms are great antennas.
A very efficient antenna system, and everyone should use one. If you
don't
use a windom at field day, you ain't really living.. Those funky fed
tuner/choke
G5RV's also have a special place in my heart.
Greatest antenna I've ever used.. :/ Grrrrr... I still remember
losing about
3 mm of tooth length due to excessive grinding when using a "funky
fed" G5RV
on 80m at field day a few years ago..

Notwithstanding all the focus on current baluns, a current balun does not (by itself) prevent common mode current on an OCF Dipole feedline. The feedline has assymetric mutual coupling to the dipole and can not be expected in any configuration of significant length to be balanced wrt the dipole over a wide frequency range.

Wide freq range?

Well, 40-50uh should provide 500 ohms impedance to common mode currents on the outside of the braid of 50 ohm coax at ~2mhz, this is about the minimum usable (in my humble opinion), although I have seen designs only providing a 5:1 "common mode impedance to coax impedance", at lowest freq, in common use (and especially when spanning wide bandwidth. And, all figures used here are approx. and taken from my guess/memory/past experiments--although I am sure they are in the ballpark)

At ~10 meters, the same inductance (same current balun) will present an impedance of 7,000+ ohms to common mode currents (impedance increasing with freq though the HF bands)

It is true, coupling to the coax, past the current balun can occur (and probably most noticeable at low freqs/high power.) I seen a post by Richard addressing that very problem, I believe, and he is using ferrite beads along a section of coax leading away from the antenna, and apparently in addition to some other current balun at the antenna. I have seen others using an additional 1:1 current balun 1/4 wave away from the antenna on the coax, or near their rig.

However, you will recognize that "magical" point where you realize minimum/reduced/tolerable common mode currents as the coax can be moved about without wild swings in SWR performance and you have a good match over the freqs/bands which the antenna is designed for (given that you don't have one end of the antenna close to a large metal building or some other structure/object providing an object to couple to and set up

a LARGE imbalance.)

Now, the above is only VERY general. As even the
bifilar/trifilar/quadfiler windings and their spacings are of importance
to a properly designed and constructed balun and will affect its'
performance.

I make only VERY GENERAL statements in the construction of these baluns
and I don't wish to accept ANY responsibility in the results of someone
using them.

There are plentiful designs, many-many tried and true, available on the
net and I leave finding those as an exercise to anyone wishing to use them.

There is also abundant formulas/equations and examples given, on the
net, on how to design your own (material to use for rod/toroid, wire,
spacing, etc.)

And someday we will talk about the "rest of the story", those guys who
can hook a coathanger to their rig with a wet thread and realize good
characteristics!!! (well, almost <grin>)

Personally, I use the current balun whether it appears I need it or not,
I find the "insertion loss" tolerable. But, I agree, in a perfect world
there would be a better solution ...

We have used OFC dipoles here for a few years at field day. They fill a very specific set of needs for us. 1) They are simple to put up 2) The feed line coming from one end of the dipole is shorter than from center feed dipoles in our setup. 3) OFC dipoles offer an impedance at the end of the coax that is within the range of the tuners built into our radios on the bands that are important to field day. This simplifies our setup and operation. 4) They work as well as an antenna of that

physical length on any one frequency would no mater how it's feed.

The radiation pattern from an OFC is set by the length of the wire not where RF is feed in/out of the antenna. In our setup open wire line and tuners would be a pain in the butt, and an operational inconvenience that gains us nothing. Fan dipoles or separate dipoles are hard to setup and or tune and would perform no better for us. The antennas we use were built by myself and use a 4:1 current balun which minimize feed line radiation. On 80/40/20m we can easily match the antenna with the built in tuners so the SWR must be under 3:1. OFC dipoles don't work well on 15m but with the current sun spot cycle not a problem. We see no indication of common mode current problems, so we don't worry about it, we just operate and have fun.

2145. Measuring Antenna Efficiency

Newsgroup: rec.radio.amateur.antenna
Date: 2007-03-05 16:04:17 UTC
From: Wayne <mygarbagecan@verizon.net>
Message-ID: <5cXGh.391$iD4.256@trnddc06>
Source record: 45159

When the subject of antenna efficiency comes up, it often involves a discussion of ground losses on verticals. What about, for example, a dipole? Could one calculate "power out/power in" by measuring the VSWR and declaring that everything not reflected was transmitted? It would seem more accurate to actually measure power out and power in, but that introduces inaccuracies by having to calibrate the setup. Thoughts?

2146. Re: Measuring Antenna Efficiency

Newsgroup: rec.radio.amateur.antenna

Source record: 45160

There's no direct way to measure the total power being radiated other
than sampling the field at many points in all directions and
integrating. "Reflected" power is not power that isn't transmitted. You
can find the power being applied to the antenna by subtracting the
"reverse" or "reflected" power from the "forward" power, but that tells
you nothing about what fraction is radiated and what fraction lost as heat.

Roy Lewallen, W7EL

I just started using the ARRL provided program, mobile.exe , for some mobile antenna design work. I see that one of the figures required to be input is ground loss.

Which raises the issue for me, how does one measure, (or calculate), the ground loss in a mobile antenna.

I am working primarily with 80M mobile antennas on medium sized motorhomes.

Mike, it wasn't for sympathy, I am a very comfortable happy man
enjoying a very happy and rewarding life.

I explained how I was able
to generate the Gaussian antenna arrays where people much cleverer
than I are unable to see what I see. Even when the item is placed in
front of them their minds will not allow them to accept it this
because the regime of learning is based on remembering the sequencies
of following a formal path. This teaching does not allow forays off
the beaten path
and queastioning in general because the professor who is the informant
is also the judge at the end of the semester and a student is not
there to challenge his thinking
Every body here is convinced that antenna programs have proved their
worth but suddenly they don't want to believe that they are cleverer
than the user. If you think about it most people who are successful
become that way because they have experienced all the wrong ways while
foraging.
Many people with a damaged brain excell in certain areas and where it
is not understood. My brain was a network of communication threads
like a webb when parts decayed preventing communication. In time they
reform if you are lucky and possibly some develop at a faster pace
than others.
This is what may have happened to me, who knows what happens
in a brain>? George Green went to school for one year and then went to
work in a flour mill. Yet somehow he expanded
mathematics with his understanding of the term equilibrium
Go figure. The brain is a wondourous thing but there is a portion
there that retards all progression even with the brightest of minds in
all humans which humans themselves cultivate in competition with other
humans.

>
> The bottom line should be is EZNEC accurate? Has the programming been
> held within the confines provided by the original provider'

What you are referring to is called "validation" of the modeling code. Since EZNEC uses the NEC2 engine (or the NEC4 engine) underneath, the inherent modeling accuracy is that of those engines.

> the U.S. government. Who overseas the content of this so called
> program.
The same as is true of virtually every other RF and EM modeling program out there.. The manufacturer of the program oversees it. You, as a customer, get to run whatever validation suites make you happy. If you don't like the results, don't use the program. If you find a bug, you report it to the mfr, and usually they roll out a new version sooner or later that fixes the problem. This is the advantage of using a provider that has been in business a while.. they've gone through the release cycle more than once, and they've got lots of eyes looking at the product.

While looking at source code sounds nice, I suspect that very, very few of the people who use modeling codes would be willing to take the time needed to go through them and understand how it works, much less try to find bugs.

But it does happen. Every few years, you see Jerry Burke at LLNL announce some minor change in the NEC code base to address some bizarre corner case.

If it has a patent then all would or should be revealed
> in the patent disclosure. Has anybody taken this for his own use for
> the advancement of science which is the reason for patents?

Or, even better, they could reveal all in a peer reviewed paper in the technical literature or in a technical report. Gosh... isn't that what the NEC folks did. There's hundreds of pages of documentation explaining the theoretical underpinnings of NEC, how it was validated, etc..

If you're interested in the optimizers....well, there's a raft of papers and books on the virtues and problems with various optimizers, both in general and in combination with NEC or other modeling codes. Yes, in most cases, you have to wonder if the implementation of the algorithm was properly done, e.g. Excel uses the Nelder-Mead algorithm in it's "solver".. and MS doesn't tell you how they exactly did it.. so it's up to you to find some good test cases and see if it works like you think it should. Or, do reasonableness checks on the output.. but that's

something you should do with an optimizer in any case.

> Has anybody upgraded the assigned patent for the sake of science
> or has something not been disclosed to prevent true examination
> and as such invalidates the patent? Does the government have the
> option of review of all algorithms or are they in the same position
> the country is with voting machines? Basically the purchaser is really
> in the position of caveat emptor especially since all programs provide
> different results!

You betcha... You gets to pay yer money and you gets to take yer chances.

But in practice, the reputable mfrs of modeling codes tend to provide validation examples, if only because that's how they do their own internal testing. For example, everybody runs the examples in the NEC manual, because those have been extensively validated, so if your code gives the same result as the NEC output (subject to the limitations of NEC and your code), then you say, "yes indeedy, my program works ok!"

2151. Re: Four square antenna and Roy

Newsgroup: rec.radio.amateur.antenna
Date: 2007-03-05 17:46:14 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <12uolre51qlui0a@corp.supernews.com>
Source record: 45164

I've never claimed credit for the four square antenna, and no one makes claims on my behalf. If anyone, friend or not, is claiming that I am the originator of the four square antenna, he is in error. As often the case, I have no idea where Art got his information, but if he will give the name of this individual and where the alleged misinformation appears, I'll contact him and tell him the true story of the origin of the four square, which is as follows.

To my knowledge, its first creator was Dana Atchley, W1CF (now SK), in association with others. He was certainly the first to give it that name. Its introduction to the amateur community was "360 degree - Steerable Vertical Phased Arrays", by Dana W. Atchley, Jr., W1CF, Harold E. Stinehelfer, ex-W2ZRS, and Joseph F. White, PhD, in April 1976 _QST_. Certain aspects of the antenna were patented in U.S. Patent 4,123,759 (Hines et al), but no restriction was ever imposed or enforced on the use of the patented material to my knowledge. The article and patent promoted the use of Wilkinson power dividers to supply power to the elements, a method I knew which wouldn't produce the claimed results. This resulted in my writing a long paper on phased array theory which I sent to anyone who requested it at for the cost of duplication and postage. Dana got one of these, and saw the error of using the Wilkinson feed. The paper ended up being published as a major part of Chapter 8 of the _ARRL Antenna Book_, where it's been for many years. You'll find the _QST_ article by Atchley et al referenced at the end of the chapter.

Anyone who has EZNEC, including the demo, of version 3.0 or later (when the Antenna Notes feature was added), is invited to open the 4square.ez example file furnished with the program. Once opened, click File, then Edit Antenna Notes. This will open the Antenna Notes file for the 4 square example antenna. The first sentence is "This popular phased array was invented by Dany Atchley, W1CF."

NEC-2 has been in constant use for about 30 years, and it's used daily to design antennas for a vast multitude of purposes -- antennas which are used by millions worldwide. It has been shown, over and over, to to agree closely with measured results. This shouldn't be any big surprise, since it uses fundamental equations which have been known and verified for over a century. There are, of course, some limitations to its abilities, and situations where it gives erroneous results. The vast majority of these have been found and well documented. And like any modeling system, computerized or otherwise, a good deal of skill can be required to match the model with the real object.

Anyone who claims to have discovered principles which are beyond those incorporated in current programs has a heavy burden of proof to bear. The very first hurdle to overcome in order to gain any semblance of credibility is comparison of carefully and professionally measured data with results from a carefully and professionally created model. If the differences truly are unexplainable by known deficiencies, then further investigation is surely warranted. Vague claims, speculations, and arm-waving with a total lack of any quantitative data are far short of what is needed to gain the attention of anyone who has seen, over and over, the successful results these programs routinely provide.

Computor programs made by professionals do not agree with each other
so there is a problem. Who would use a digital calculator with
confidence when all calculators are only roughly accurate.
As far as "vague claims" professional programs of today validate my
"speculative" claims. it does not threaten anything of yours since
yours are just number crunchers for pre made designs and even then
they are not totally accurate.
Nobody but nobody has invalidated my expansion of the law of statics.
Nobody.Didn't the same thing happen to all the masters at one time or
another.

Among EZNEC users are aerospace companies, U.S. and foreign government agencies, universities, domestic and international broadcasters, cell phone providers, space agencies, telecommunications companies, and a very wide range of others. They are designing antennas which you make use of daily.

The purchaser truly is in the position of caveat emptor, and the legal notice included with EZNEC carefully spells this out in legalese. But EZNEC also has an unconditional full money back satisfaction guarantee, and none of the above users have asked for a refund.

Hi Ed,

Work it in reverse. Put in various values and note their loss.
Compare to your own situation. Choose the value that comes closest to
that.

How do you compare? Measure against a reference antenna, while trying
to maintain the same conditions. THAT is the hard part. The
reference antenna's loss should be known (and even that is difficult).

Another way is build a software model that is the best of all worlds
(no Ohmic losses ...or at least the fewest). Compare drive conditions
of the model to the one on your motorhome. The difference between the
two is the loss, take this value and put it into your software.

I would suggest that the various codes used by professionals DO agree,
within their stated uncertainty limits or the constraints of the model.

A simple mutual coupling approximation based on series expansion of the
exponential integral for idealized dipoles will be very close to that
derived from, say, a method of moments code like NEC2, but they will be
different, because the underlying model is subtly different. However, a
skilled user of such codes is (or should be) aware of the limitations.

Likewise, you can model a vertical monopole over ground with a simple
model (like assuming the ground is infinitely conducting and the
monopole is infinitely thin). Or you can model it as a finite thickness
monopole and a finite conductivity dielectric ground with uniform
properties. Or, you can model it with the rivet heads holding the
aluminum together, the dielectric guy wires, and the actual EM
properties of the soil that have been determined on a 10cm grid for the

surrounding km.

The answers will all be different in the details, but simultaneously the answers will be the same within the limits of the approximations used.

The devil is in the details of those limits, eh?

Art,

You may have missed my earlier message, or perhaps it was not clear. I will try again.

Gauss' Law is one of the four standard Maxwell Equations. Therefore, statics has already been expanded to encompass all of classical electromagnetism, a long time ago.

You may have invented a novel antenna configuration, but you did not "invent" the extension of Gauss' Law to HF and antennas. There is nothing to validate or invalidate.

The reason for focus on ground loss on (HF) verticals is that, unless you have taken extreme measures with a ground system, ground loss dwarfs other losses and in that case dominates considerations of efficiency. Next would come loading coils.

> dipole? Could one calculate "power out/power in" by measuring the

Half wave dipoles made from practical materials are usually very high efficiency, losses commonly range in the area of 1% to ~3%. Loading coils are a significant loss element in loaded dipoles. Some folk (eg ARRL) have a mind that linear loading (folding the conductors back on themselves) is lossless, but my analysis of the Cobra shows that is not the case, see http://www.vk1od.net/cobra/index.htm . Even other lengths of unloaded dipoles may be very efficient, but the feedpoint impedance may drive huge losses on the feedline and so whilst the radiator is efficient, the antenna system may be inefficient.

Components of an antenna system interact with each other in a complex way, and it is important to analyse the entire antenna system (radiator, earth, transmission line, balun, ATU etc) to obtain a correct understanding of how the system works overall.

> VSWR and declaring that everything not reflected was transmitted? It

Roy has already explained to you that you have some misconceptions about VSWR, "forward power", and "reflected power".

There has been another raging discussion here about what happens to the "reflected power", it isn't necessarily, and isn't usually lost (ie dissipated as heat), but as I have stated above the feedpoint impedance may drive huge losses on the feedline, it may also reduce the power available from the transmitter and may reduce the transmitter efficiency.

> would seem more accurate to actually measure power out and power in,
> but that introduces inaccuracies by having to calibrate the setup.
> Thoughts?

In terms of efficiency on the larger scale, a significant of power is lost in the process of reflecting some rays from real ground.

Ed, I assume you mean ground loss stated as an equivalent series
resistance.

If you measure the feedpoint impedance or the VSWR of a short loaded whip
at resonance, you have a figure total resistance either directly reading
or from VSWR, R=50/VSWR. (Of course, those measurements need to be made
without any impedance transformation even if you might use such in
service.) That feedpoint resistance comprises equivalent ground
resistance and the equivalent of the antenna losses and radiation
resistance. If you can estimate the second component from models, the
equivalent ground resistance can be estimated by deduction of the
equivalent radiator R from the measured feedpoint R.

Thanks for the reply. My dipole example is intended to avoid transmission line issues by not having one, and the elements are assumed to be reasonably low loss. If I do some quick back-of-the-envelope calculations, for a VSWR of 1.3:1, I get an efficiency of about 98.3% (using the equation 1-gamma^2). Assuming a resistance of 1 ohm in the dipole conductors the efficiency I calculate is about 98.6% (72/73).

Are there any other loss issues missing in this example.

I would suggest that for the purposes of rough and ready estimation, and
considering the measurement uncertainty from most ham measuring gear,
you could estimate the radiation resistance of an 8ft long mobile
antenna without a tophat at being about 25-30 ohms for 10m, 5.5 ohms for
20, 1.5 ohms for 40, and 0.4 ohms for 75/80. Probably close enough with
about 1.5 significant digits accuracy.

Jefferies has similar numbers at:
http://www.ee.surrey.ac.uk/Personal/D.Jefferies/radimp.html

You probably mean 1 less the magnitude of the reflection coefficient
squared, which I would write as 1-|Gamma|^2 or 1-rho^2. Your implication
is that "reflected power" is (necessarily) lost, that is wrong.

If you do not have a transmission line, why are you trying to use
transmission line concepts to solve the problem? The power delivered to
the antenna is the real part of V^2/Z where V is the feedpoint voltage
and Z is the feedpoint impedance.

> resistance of 1 ohm in the dipole conductors the efficiency I
> calculate is about 98.6% (72/73).

The number you guess could be reasonable, and if it is truly the
equivalent R at the feedpoint (rather than R/unit length * length), it
does impact the antenna efficiency in the way you calculate.

Are those figures for an unloaded vertical?

Ed was talking 80m, and if your 0.4 is for an unloaded vertical, it is probably about 50% higher for a centre loaded vertical, so ~0.6ohms, and that sounds reasonable.

Ed still needs to quantify the equivalent loss resistance of the stuff above the feedpoint, and that will depend principally on the loading coil, but likely to be in the range 5 to 20 ohms. Measurement in situ of total feedpoint R (which is mainly loss resistances above and below the feedpoint in this case) isn't so hard (as I described) and probably better than an estimate.

Ed, it seems to me that in comparing similar resonant (80m) loaded verticals, the one with the worst VSWR (direct fed at the base) is probably the most efficient one. This implies that the antennas that are advertised with a low direct feed VSWR are less efficient, they pad the antenna with lossy loading to improve the VSWR.

Exactly as it does when transmitting, in reverse.

> The radials are in free space.

No, not really. If high enough, they behave like they are, but they're
not that high in typical HF applications.

> Do the radials reflect or
> emit a wave that cancels out?

No. The radials radiate very little. They certainly interact with the
vertical portion of the antenna, but not in a way that could be
described as "reflection" in any sense.

> Is it possible to model this antenna in
> receive mode with a NEC program?

Yes. Look up the explanation and examples of plane wave excitation in
the NEC manual. If done correctly, you should get identical but
reciprocal results as when modeled as a transmitting antenna. (EZNEC
doesn't implement plane wave excitation, but you can create an
essentially plane wave by adding a small "transmitting" antenna with
source a few wavelengths away.)

> I am trying to work out whether the
> electromagnetic principles that apply in transmit mode also apply in receive
> mode.

Others have wondered the same thing, but somewhere around a hundred
years ago the problem was solved. They do. A google search on antenna
reciprocity should get you started in the learning process.

The definition of efficiency with respect to antennas is very well defined, understood, and agreed upon in all the amateur and professional literature. Virtually every text and professional paper uses an identical definition, and that is: the fraction of the power applied to an antenna which is radiated. I know that Art often uses the term to mean several other different things which I don't believe he's ever clarified (at least not that I could understand), so some caution should be used in making assumptions about its meaning when used in this newsgroup.

As an example consider a horizontal 75 m dipole, constructed of
#14 AWG copper, at various heights above an average ground.
The radiation efficiency, according to NEC, is shown below:

height 10 ft, efficiency 14%;
height 30 ft, efficiency 54%,
height 90 ft efficiency 82%

The above results do not include the ground wave, which
can be considered lost power. Ground absorption also increases
with proximity to the ground.

David,
The word reprocity is often badly used when comparing transmit and
receive.
One cannot avoid the question of the enviroventa or medium conditions
relative to the mode and direction of the radiation travel. Another

thing you might want to pursue is how a receiving antenna separates
radiation into different vectors. It is generaly stated that actions
are reciprocal but I believe that is an emperical response of which I
personaly have no scientific knoweledge that backs up that assertion.
Maybe some where it is all written down somewhere and everything is
really known about antennas

Frank,

What is the figure for free space? I suspect closer to 99%. If that is
the case, don't your figures include loss (or absorbption) in rays
reflected by the ground?

Owen

This is often the case, especially with small mobile antennas. It has the added advantages of making an antenna more broadband and quieter, both considered virtues by amateurs. The closer an antenna resembles a dummy load, the better it's perceived to be.

Short monopole, linear current distribution, rough approximations.

capacitive end loading would tend to make the Rrad higher (by as much as
a factor of 4 in the idealized case, since the general relation goes as L^2)

You can measure the feedpoint Z with probably 10% accuracy, but it's the
Rrad that's the tricky thing to determine, and without that, you'll not
get the ability to infer Rloss from Rfeedpoint. Of course, if the rough
and ready approximation shows Rrad to be 0.5 ohms, and you measure 25
ohms at the feedpoint, then you can just ignore Rrad, and assume the
loss resistance is 25 ohms (since the uncertainty in the measurement is
2.5 ohms)

I'd agree.. Unless the loading scheme is some sort of tapped
autotransformer at the base, in which case it's a bit tricky to figure out.

Art,

Pick up any book that includes a discussion of Maxwell's Equations. One of the equations will be something like:

div D = rho

The common expression of Gauss' Law is something like:

div E = rho / epsilon

By definition:

D = E * epsilon

Therefore Gauss' Law is already included in all radiation and all antennas. You can perform any amount of mathematical manipulation you wish, including expressing these equations in integral rather than differential form. The integral form is commonly used when discussing the Gaussian "pillbox" in electrostatics. However, the physical conditions remain the same.

You have stated on many occasions that you understand this sort of vector manipulation, e.g., you throw curls around freely, so no further explanation should be necessary.

A simpler approach, depending on the accuracy needed, might be to convert some matlab codes. Orfanidis's book has matlab routines to do the mutual coupling calculations and the transmission lines and to generate a radiation pattern from the element currents. heck, he might even have a LPDA model in there.. it would be a good exercise for a class on computational electromagnetics. If it's a free space model, that might be the easiest.

I have heard, but do not know from my own experience or anyone I know (essentialy it is totally unsubstantiated rumor), that the NEC repository C code version of NEC (converted by something like f2c) has a number of problems. Given the age of the original FORTRAN code and its coding style, I can believe that a machine translation might introduce artifacts.

Easier said than done!

The port by the Otago Uni (NEC2++) looked promising, especially as they integrated the S-N ground model code into the main programs and was real fast, but it has subtle bugs. Unfortunately, their decision to make small changes to the output format frustrates automated testing and comparison to baseline versions, and it is a student project which seems to have stalled.

Correct Owen. NEC shows 97.3% for free space, and 100 %,
as expected, with perfect conductors. Certainly the loss does
include absorption of the reflected rays. As mentioned before, in
previous threads, it is very tedious to determine what percentage
of the "Loss" is due to ground wave radiation. One of these
days I will write the code necessary to compute the actual
TRP including ground wave.

Congratulations, Art!
According to my computor(sic), you have taken over sole possession
of third place in number of posts on the RRAA newsgroup.Number
one is, of course, Fractenna. Frack's total will never be matched, so
second or third place is quite honorable. While we all miss Chip,
it's better that you and he are not on stage at the same time. He would
learn that your newly discovered Gaussian Array is nothing more than
a self-similar array, falling under his broad portfolio of Fractal Patents.
That fact would upset his equilibrium, thus ensuring a flurry of threatened
lawsuits.
Regardless, congratulations are in order for your accomplishment, as
the educational aspect is second only to the entertainment value.

I don't seem to be communicating well, but that's not unusual. It's a shortcoming I have. So I'll try again.

There is not even an approximate relationship between SWR and efficiency, so what you calculated was not an approximation of the efficiency. It was simply a number which has no relationship whatsoever to the efficiency. You could have used any equation you might dream up, and the result would be as meaningless as the result you got.

And of course that's just where modeling becomes valuable. Even a crude model will probably predict Rrad better than a "rough and ready approximation". And a decent model will very often give a value for the feedpoint Z that's more accurate than a casual or, sometimes, even a careful measurement.

I should elaborate a little.

The average gain is the ratio of the total power in all directions at a great distance (beyond the point where the surface wave has decayed to a negligible value) to the power into the antenna from all the sources. (There's a factor of two also involved when using a ground plane with NEC but not with EZNEC.) So the average gain is the efficiency if you consider ground reflection and the decay of the surface wave to be part of the loss.

Yes. The copper cactus cleverly combines separate antennas for each band on the same structure. However, if your needs for 440 are modest -- local repeaters, mostly -- then just make a 2m version and you will find it is also a good match on 440.

The limitation is that that a 2m J-pole on 440 has an elevated main lobe. It works well for me, but probably not as well as elements specifically cut for 440 would work.

> I am working primarily with 80M mobile antennas on medium sized
> motorhomes.

My thanks to those who have already replied to the above question. To re-iterate, I was using ARRL's mobile.exe program to model some proposed antennas for my RV. I don't yet have a design built. Ground loss resistance is one of the parameters to enter.... and entry difficult to figure without a physical antenna, it appears.

My proposed antenna will be primarily for 80M. It will be center loaded, approximately 8 to 12 feet tall, with a 4" diameter air wound coil (coil parameters can change), and will be mounted such that the FEEDPOINT/base will be at the top of my rear ladder, which is about 10 feet off the ground. The ladder is well bonded to the under chassis of the vehicle. I may use a capacity hat at the TOP of the antenna... or maybe not. I am wondering how ground loss/resistance is effected by my having the bottom/feedpoint of the antenna so high off the ground, not to mention, I wonder how to calculate or guess what it is at all.

Ed

This is what I am proposing to build.

>I wonder how to calculate or guess what it is at all.

Hi Ed,

The more practical consideration is: "What can you do about it?"

The loss is going to be in frame and chassis connections where the
loss is going to predominate. Another matter is getting over the idea
that what sticks up the air is the principle part of the antenna. You
may as well get used to the idea that it is only a tuned radial for
the bigger element, your RV. And what polarization is that RV going
to present to the world? (Probably horizontal.)

Hmm is it so ?. I don't know. If you ask me, every person does have
it's own motives to decide if he buys or uses one program or the
other, and how much he does trust the results obtained with the
method(s) or underlaying software used by the program.

Try SatPC32, at http://www.dk1tb.de/indexeng.htm It is not freeware, but the demo is fully functional in all respects, except that each time you start it, you need to reenter your longitude and latitude. If you do decide to register it, do so through AMSAT, and the full amount goes to AMSAT to fund operations and more satellites.

The graphics, at several levels of resolution, and multiple views, are good. It also supports frequency control and antenna pointing for just about any rig or interface you can imagine.

I was using average gain for my calculation of efficiency; i.e.
XNDA = 1001, or 1002. I have also been considering
the factor of "2" in the results. To be accurate, and to
determine the radiation resistance of a structure, you do
need to include the surface wave. The only way I
can think of doing this is to sum "E X H" close enough
to the radiating structure so as to include all its
elements. At the moment I am using Excel
to compute the Poynting vector.
Even then, there is some question as
to how much ground absorption effects the results
between antenna and the hemispherical radius
of computation. I have noticed some weird results
if you get too close to the ends of a buried radial system.

I think you are asking for a tutorial on how to apply the Smitch chart without needing to understand transmission line theory.

I am sure that one could teach a person the mechanics of solution of specific problems, but that is all they will know rather than how to apply the Smith chart to the solution of problems generally.

Today, when computer power allows precise solution of problems that were pretty ugly on slide rules, the real benefit of the Smith chard IMHO, is as a visualisation tool. If you take away the understanding that gives its value as a visualisation tool, you have a crude graphical solution to problems that can be more precisely and more conveniently solved with a computer program (whether or not it displays results on a Smitch chart).

Did I say crude? Yes, graphical solutions on a Smith chart are prone to gross error in some parts of the chart. That downside is to some extent masked by the accuracy of the "known" quantities being plotted, but software that solves the transmission line problems, including applying line loss, are more accurate on high VSWR problems. People like McAlpine worked at approximations of high VSWR scenarios to overcome the shortcomings of that area of the Smitch chart, but that is not really needed today, just solve the exact equations in a computer program.

That is not to say that there isn't a place for Smith charts, but IMHO the greatest value is as a visualisation tool, and that requires an understand of the underlying maths, but not the tedious solution of the underlying maths.

Yes, that is what I meant and what I should have said, instead of just
"ground reflection". Thanks for the correction.

it is in error, by definition. if you want a 'Gaussian' law that is
something other than as it is written, then write your own law, make some
predictions not covered by the existing maxwell's equations, and let the
papers get accepted by a peer reviewed journal. anything less than that and
all you are doing is blowing smoke.

Also, try:
http://www.amsat.org/amsat-new/tools/predict/

Simpley add your Lat, and long. (In Decimal
equivalent, NOT in Minutes, and seconds 30 mins
= .5, 15 mins = .25, ect.), and your elevation IN
meters, NOT feet)(also can use grid square). will
calculate for some 25 different satelites. Amsat
also has several programs available and at minimal
cost (and helps support new satelite projects)!
Hope this helps Jim NN7K

David wrote:
> But if the field of the radials cancels out, is there any benefit in having
> radials in receive mode?

Yes. If you eliminate the radials, you have a single conductor wire (the "antenna") connected to a feedline or receiver. The feedline or receiver has two terminals which comprise an electrical circuit. If you leave one of those conductors open circuited, current induced by the passing signal will not flow from the "antenna" to the receiver or feedline. In practice, it's nearly impossible to really open circuit the other conductor (that is, the one not connected to the "antenna") -- the outside of the feedline, if coax, will become the other half of the antenna, as will anything conductive connected to the receiver chassis. This is often undesirable because those conductors are more likely to receive noise from local sources than if the entire antenna is in the clear. It will also distort the antenna pattern, possibly in a major way.

I've put "antenna" in quotes because the vertical wire is only half the antenna. The other half is either radials or, if radials are missing, the other conductors I mentioned.

I have a problem with a number of vhf transceivers that interfer with each other. There are 8 closely related frequencies involved and the problem only exist when 4 or more of the frqencies are in use at one time. Circulators and filters are not practical solutions. I am hoping that spacing the antennas further apart will help but I would like to know how far apart should that be before I decide to try some other method of relief. The radio now radiate approximately 5 watts, AM modulated in the VHF aeronautical band 118 to 137 Mhz. Antennas are arranged in a rectangular array 4 antennas long and 2 wide with 8ft spacing between adjacent antennas. The transcievers have neither tuned front ends or outputs and adding filters is not an option.

I have observed that the same type of intermod distortion exist at a transmitter only site but this does not appear to be a problem because the receivers are not co located with the transmitters. The rx site is about a mile away. Also I have obseved that a rx equiped with the same tpe of antenna placed abot 100 ft from the transciever sites antenna array does not pickup the intermod. This leads me to belive that the distortion is a result of signals mixing in the transmitters and not in the receivers.

How far apart should the antennas be? I ask this only assuming this will cure the problem.

Jimmie

I'm in a hotel in Jax, FL, unable to use my routine connections to rraa, so I'm learning my way around in unknown territory here, and hope to make a post that will appear.

I've been reading this thread with interest, but the discussions appear to be only academically related. On the other hand, I've made measurements that prove the sailent points of these academic discussions. These measurements were made since those reported in Reflections 2, and will appear in Reflections 3. However, they are available on my web page at www.w2du.com. Go to 'Preview of Chapters from Reflections 3' and click on Chapter 19A.

You may want to disregard the first portion of the chapter, which is an epilog to Bruene's fiction concerning the conjugate match. The pertinent portion here is that which reports in detail the step-by-step procedure in measuring the output impedance of a Kenwood TS-830S transceiver feeding a reactive-impedance load.

With a careful review of these steps I'm sure you'll find empirical proof of the academics appearing in the previous posts.

Walt, W2DU

Hi All,

Per recent correspondence from Walt Maxwell, he has asked me to post
his contribution:

Hi Richard,

I'm in a hotel in Jacksonville, away from my home computer, and at
this time I can't access the rraa to send, can only receive, so I'm
asking for your help.

I've been reading the posts on this thread and find it interesting.
However, it's been only discussed academically. On the other hand,
I've made measurements that prove the results described, measurements
made since those reported in Reflections 2.

I'd like for you to alert the posters on this thread to see Chapter
19A that will appear in Reflections 3, which is available for download
from my web page at www.w2du.com. The entire chapter was written as a

final epilogue to Bruene's fiction, but the portion pertinent to the thread is in the last portion of the chapter concerning the measurements made using a Kenwood TS-830S. Therein lies the proof.

It would be nice if you could post the entire portion of the measurements section, but that probably wouldn't work, because of special characters used in Word that wouldn't appear in the text. Anyway, I'd like for the posters to know that experimental proof exists to support the claims made in the thread.

Thanks, Richard,

Walt

2223. PVC pipe for spreaders

Newsgroup: rec.radio.amateur.antenna
Date: 2007-03-07 17:48:10 UTC
From: ka9s3@comcast.net
Message-ID: <1173289690.111109.163520@p10g2000cwp.googlegroups.com>
Source record: 45037

I am contemplating making a remotely tuned "X" beam for 40m using copper weld wire supported on a PVC pipe framework. I need each arm of the horizontally oriented "X" support framework to be 18ft long. I am considering telescoping 10ft of 3/4 inch PVC, 2 ft into a 10 ft piece of 1 inch PVC pipe. When I temporarily do this at the hardware store, I get a very heavy, very wobbly spreader. I expect I will guy these spreaders (both vertically and horizontally) with Dacron rope at the half way point and let the copper weld wire provide the guying for the spreader tips.

My concern is the flexibility and weight of the PVC. Too flexible is the concern. I can imagine the spreaders developing wind resonance and starting a hula dance in the wind. This could become destructive for the wire and rope.

What are your insights on this idea?

P.S..I don't want to get into the UV degradation issue please.

- Jeff

Since this is in the Aircraft Band, and is a Ground Station, you would
be significantly better off to seperate the antennas Vertically, rather
than Horozontally, or both. Vertical seperation will give you much
better isolation per unit of distance.

Owen Duffy wrote:
"Breaking out of the previous thread to explore the "power explanation"
in a steady state situation:"

All OK as I see it.

Bird tells us that if you have significant standing waves, reflected
power is 10% or more of the forward power, and the ratio of reflected
power to forward power is then easily determined on the Bird Thruline
Wattmeter. Ratio of the reflected power to forward power is easily
converted to VSWR.

Bird supplies, charts, slide rules, and a formula for this conversion.

Bird confirms: "Power delivered to and dissipated in a load is given by:

Watts into load = Watts forward - Watts reflected."

Owen Duffy told us 100W is developed in 70 ohm load and the DC input
power of the transmitter is 200W.

Obviously 100W is dissipated in the transmitter and the efficiency is
50%.

Best regards, Richard Harrison, KB5WZI

Instead of using PVC which sometimes get unwieldy either by weight or size,
try finding some WILD growing BAMBOO and paint it with either shellac or
some Marine Varnish. You can extend the lengths by using some short pieces
of PVC with some outdoor glue.

I see where you are coming from, two antennas mounted in each others
vertical null. This is doable. As a matter of fact they make dual
antennas specifically designed for this purpose. This will allow me to

mount the antennas with double the horizontal spacing I have now.

2229. Using a tower as a J-Pole for 20 or 40 Meters

Newsgroup: rec.radio.amateur.antenna
Date: 2007-03-07 21:05:47 UTC
From: Eric <reply.in.group@nospam.no>
Message-ID: <pan.2007.03.07.21.05.45.112782@nospam.no>
Source record: 45043

Have any of you tried using a tower as a J pole antenna for 20 or 40 meters?

According to calculations, it looks like a 50-foot tower would be about right for 14.1 MHz with a 16.6-foot matching section that could be made out of aluminum tubing and spaced out about 1.5 feet.

This should make a decent low-angle radiator without needing any buried ground wires (which would be difficult to put in around here).

Then I thought maybe a taller tower, perhaps 80 feet, with a triband beam on top, could perhaps be made into a J-pole for 40 meters with the beam acting as a hat.

Obviously I haven't thought this through very much but I was just wondering if any of you had tried any of this or knew of any articles or websites that describe such a project.

Hi Walt,

I have read your document with interest, and will reread it a couple of times yet.

The measurements are interesting, and on a first read, appear consistent and in agreement with how things work as I understand it.

However, I don't believe any of your measurents actually reveal the source impedance. You have shown the impact of the changed load on the transmitter. You have demonstrated admirably the transformation of the two external loads to the load seen by the plate(s), and you have shown what the transmitter looks like from the antenna socket with a resistor in place of the valves.

So, IMHO, the promise "The output source resistance of the amplifier in this condition will later be shown to be 50 ohms" is not fulfilled.

It is my view that the statement "Because the amplifier was adjusted to deliver the maximum available power of 100 watts prior to the resistance measurement, resistance RLP looking into the plate (upstream from the network terminals) is also approximately 1400 ohms" is not proven.

If we were to view the plate as a generator, and the pi network as a lossless flexible variable impedance transformer, and you were to adjust the pi network for maximum power transfer, that would imply that the impedance loading the generator was the complex conjugate of its equivalent series resistance... IF and ONLY IF the generator can be accurately represented by an equivalent series circuit of a fixed voltage generator and fixed equivalent series impedance.

The question is can the plate (or the whole transmitter for that matter) be accurately replaced by an equivalent series circuit of a fixed voltage generator and fixed equivalent series resistance (independent of load).

How would such a simple model deal with the case of a transmitter that at maximum power output is close to voltage saturation (ie cannot develop more output voltage) and close to current saturation (ie cannot develop more output current)? These non-linear behaviours close to operating point are not captured in a simple linear equivalent circuit.

Owen

MRW,

I had forgotton writing a little calculator that will find the receive power given field strength given field strength, freq, antenna gain etc, it is at http://vk1od.net/sc/FS2RPCalc.htm . For your purposes, make the "Field Strengh" and "Receiver" bandwidths and distance to source the same as each other, the actual values don't matter (well, so long as they are greater than zero).

Another relay:

Hi All,

I have now been able to access this thread from my hotel room In Jax,
FL. I've read the posts with interest, but they appear to be only
discussions in academia. On the other hand, I have made measurements
that prove the salient points being discussed here.

My measurements include those made since those reported in Reflections
2, and are going to be available in Reflections 3. However, they are
presently available from my web page at www.w2du.com. Go to 'Preview
Chapters from Reflections 3' and select Chapter 19A. You may disregard
the first portion, which is intended as an epilog to Bruene's fiction
concerning the conjugate match. The pertinent portion here is a
detailed step-by-step description of the measurement procedure I
erformed on a Kenwood TS-830S transceiver with a reactive impedance
for its load.

A careful review of these steps will add empirical proof to the
academic enlightenment already evident in the previous posts.

Hi Owen,

Thank you for the insightful response.

First, let me say that although the average source resistance at the plates appears to be 1400 ohms in the case I described, and IMHO I believe it is, I'm not in the position of stating that is as a fact. What I do claim as a fact is that when the transmitter is loaded to deliver all available power to its load, the OUTPUT source resistance (or impedance) at the output terminals is the conjugate of its load. I'm differentiating between the conditions at the input of the pi-network and those at the output, because the energy storage effect of the network Q isolates the output from the input, such that the conditions at the output can be represented by an equivalent Thevenin generator. At the output terminals the conditions appearing at the input are irrelevant, such as the shape and duration of the voltage applied to the pi-network, as long as the energy storage Q is sufficient to support a constant voltage-current relationship (linear) at the output for whatever load is absorbing all the available power from the network.

Thus, when all available power is delivered into a 50-ohm load the source resistance at the output terminals is 50 ohms. Please also review the later portion of Chapter 19, also available on my web page. On those pages I report the results of measurements using the load-variation method, which also shows the output source resistance to equal the load resistance when the amp is delivering all its available power.

The maximum power transfer theorem is a classic. It has been proven countless times. It is explained by Terman in his 1955 opus on page 76. It requires linearity in the area examined. A tuned circuit is often the linearizer in an r-f amplifier. It eliminates harmonics of the fundamental frequency so that Ohm`s law prevails across the output terminals of the device. Thus, it is linear. It makes no difference that ahead of the linearizer the power source is being pulsed so long as the pulses don`t appear in the output. We don`t have pulses in the outputs of our radios feeding our antennas.

When you have a conjugate match, the resistive parts of the source and load are equal by definition.

Best regards, Richard Harrison, KB5WZI

Ok, I think we are agreed that the measurements haven't directly
supported that belief.

If it were a linear source and you delivered *maximum* (as opposed to
all) to the load, I agree that the load impedance is the complex
conjugate of the source impedance. That is essentially the Jacobi Maximum
Power Transfer Theoram.

The question is whether it is a sufficiently linear source to use that
model.

Walt, I have just re-read that section and note your measurements which
explored the delta V and delta I for small load variation (delta R) where
delta R is always negative, and calculated results.

Your results are interesting.

I have seen others report quite different results, and have found differently myself on rough measurements, but I note your comments on the sensitivity of the calculated Rs to tuning/matching which might reveal why other tests disagree.

(It only takes one sound repeatable experiment that shows that the source impedance is not the conjugate of the load to disprove the generality.)

On a practical note, the sensitivity discussed above does mean that if your assertion about matching is true, it is unlikely that transmitters are exactly matched.

My measurements have been on transistor PAs with broadband transformer coupling to the load. The transmitters have had a lowpass filter with a break point well above operating frequency between the transistors and load. It is a different configuration, and although my measurements were rough, they indicated different apparent source impedance at different drive levels which questions the linear model for large signal operation, especially for modes with varying amplitude such as SSB telephony.

> meters?

hello,

I tried it, but it was not a great success
I used a tower with a TH6 as a capacitive hat
matched with a gamma match system
and 16 radials

It was working first on 80 as a quarter wave, then on 40 as a half wave, and
I tried it too on 160

In fact, it was good, but not better than a dipole at the top of the mast; I
suppose due to the very poor ground here.

pse excuse my english

I have worked with one of John's OCF dipoles on the FD night shift,
and hold and run frequencies on 75 meters all night long - with 100
watts. Can't say the exact performance of the antenna, but if I'm
holding a frequency along with the big guns on a busy day, it isn't
too bad at all.

OCF dipoles are obviously a compromise. As a multiband antenna it
better not outperform a specific band dipole.

If you have found such a *drastic* difference however, perhaps
there was something wrong with your particular antenna or setup?

Multichannel transceivers. A filter that was broad enough for full operation
of the transceiver wouldnt help and I dont think circulators work with
transceivers very well.You could TX but not RX.

The answer is NO!!

Power Amplifiers are not linear devices! [Regardless of manufacturer's claims].

My AL-80B puts out ~850 watts with ~1300 watts input. IF a conjugate match existed the output would be ~650 watts. The Zo of the 3-500 varies depending on the phase of the pulse signal. The amplifier provides a pulse of energy into the tuned circuit, tank circuit, tuner, antenna, where the reactances maintain the current/voltage under resonant conditions.

My understanding is that reflected energy is also coupled into the tuned circuits. The active device, power amplifier, may be cutoff, saturated, or somewhere on the active load line. The energy in the tuned circuit will increase the Vmax and/or Imax depending on the circuit QL. This increase in stored energy provides the extra stress on the active device. If the QL > 10, nominal design value, then 90% of the reflected energy is re-reflected back towards the load. The missing 10% produces heat in the tuned circuit.

Devices that operate from saturation to cutoff are by definition NON-LINEAR.

The tuned circuits store both forward and reflected energy. Ultimately all the power is radiated, either as a rf field or as heat.

Hi Dave,

Well, having said that, it was hardly worth constraining the rest of
the discussion with linearity, SWR, efficiency, pulses, Q, cut-off,
saturated, tube or transistor.

Sorry Dave, the statements in your above post indicates a common
misunderstanding of the operation of an RF power amplifier.

With the possibility that you will consider what I'm about to say is
in the 'he said she said' category, I'd still like for you to review
some of my writings, consider them seriously, and then we'll have
another conversation on the subject. Perhaps I can convince you that
some of your statements are just plain wrong--if not, then we both
simply go our separate ways and believe what we want.

One paper I'd like you to review is Chapter 19 in Reflections 2, also published in QEX. (I'm now in a hotel in Jax, FL, awaiting spinal surgery, so I'm not at home where I can obtain the references for you.) Then I'd also like for you to review Chapter 19A that will appear in Reflections 3. However, you can find these chapters on my web page at www.w2du.com. Chapter 19 is found by clicking on 'Review Chapters from Reflections 2', and Chapter 19A is found by clicking on 'Preview Chapters from Reflections 3'.

I would like to hear from you after reviewing these two papers. I hope this will help you understand the reason why some of your statements are incorrect. If you believe I'm wrong, so be it.

Seems unlikely to perform any different than any equal length of wire
(the length of the fundamental band, that is). Only the feed Z
changes is all (or so modeling would lead me to believe).

That's a general statement, but for a correctly fed OCF, your statement is generally false.

If an OCF is shorter than 1/2 wave for the frequency of operation, it will not perform as well as the 1/2 wave dipole. However, as the length of the OCF increases over the 1/2 wave, it generates lobes of gain in various directions. How many lobes and to where they point changes according to the relative length to the band, but there is actually gain.

You can find more information in the ARRL Antenna book or by modeling the antenna on one of the antenna model ling programs.

I tried it making mine(20M) out of conduit. Tweaking it up was a lot
more trouble than I thought it would be. Try building one for say 6
meters with only approximate deminsions, note how much tweaking it
takes to get it right them multiply this by 100. It can be a real
PITA. You are going to be fiddling with the length of the tower, the
length of the stub.

Source record: 45069

Hello all.

I need some advice regarding the electrical safety ground for a wifi antenna I'm installing on the brick wall outside my office building.

The antenna is in a 40" x 2" diameter nylon tube. It will be mounted using a standard A-frame type Channel Master side mount. A short piece of mast up from the two wall mounts to secure the antenna with U clamps. It will be up on the wall outside my office door maybe 10 feet.

I have a gas discharge unit that comes with the antenna. It mates to the bottom connector and terms with the connector for the 4' of coax wire that leads through the wall to the wireless AP unit. There is a ground lug on the side of the discharge unit to attach a lead to.

The building is on a hill so the AC units are all mounted on concrete slabs on the ground at either end of the building. There are no antennas on the roof... only two old vents from when there was a diner upstairs and the usual vent pipes from the bathrooms. Power comes in from underground to a central location at one end of the building.

The building is of wood construction with red brick facing. Shingled A-frame roof like on a house. It is about 100' wide and my office sits smack in the middle on the lower ground level.

So thats my setup. Now how and where to connect the safety ground is my concern.

1) Do I simply go straight down into the ground below and will that create any arching issues with anything else in/on the building?

2) Is it better to bring the ground lead into the building and over to the circuit breaker panel for my office (a distance of about 40') and attach to the neutral wire at that point? If so, what guage wire for that distance is required?

3) There are probably some large electrical conduits just inside the wall (that supply power to nextdoor and upstairs) where my AP will be mounted. Can I attach the ground to one of these with a suitable clamp?

Thanks for the help.

Hi Buck,

Modeling would suggest otherwise.

The difference between a 1/4 wave center fed and off-center fed (at
10% from the end) is about a 12% increase in real resistance, and
.25dB gain improvement, both favoring the off-center fed.

Are you comparing short antennas to long antennas? If so, it wouldn't
be a surprise, would it?

Coming in late, did I miss someone's extravagant claim that a OCF
could do better?

Hi Bill

When I use aluminum rod for driven elements, I thread the end of the rod
then use two nuts to squeeze the wire between them.
0.125 OD will require a small die.

Jerry

The original comment was that a multiband OCF antenna is a
'compromise' antenna and wouldn't be as good as dedicated 1/2 wave
dipole cut to frequency (or so I understood it.)

If a 135 foot OCF were compared to a 1/2 wave 160 meter dipole, the
OCF would lose, but if it were compared to a 20 meter dipole, it would
have gain in the direction of various lobes.

Yes, the comparison is between different length antennas, and you are
right, generally speaking, the longer, the better. (no doubt someone
can find an exception to the rule, but that isn't the point of this
discussion.)

The reason for my statement of 'properly fed' is that I know that the
impedance changes radically from band to band at the feed point.
Buxcomm is selling a popular OCF with a 6:1 balun to coax. I don't
think that is good as the impedance will be pretty low at the coax at
times. However, to each his own.

Feeding an OCF directly (no balun) with coax probably isn't a great idea either. I used one that way for a long time, and with great results (75 ohm indoor cable-tv coax) and switched to Radio Shack low-loss 300 ohm tv twin-lead which appeared to have better results. The best results seemed to come from a friend's setup which used 600 ohm twin lead (the good wire-man stuff) all the way to the tuner.

My favorite OCF design is still the clothesline antenna... a loop of wire to make a 40 meter dipole at 300 ohms, a 4:1 balun with coax attached and a motor at the pulley on one end. Tune the antenna by moving the balun towards or away from the center of the dipole. No tuner needed and it worked adequately in the man's attic, according to the article I read. It is an old design, but interesting still today. ;)

Source record: 45074

All you need for this special case are two pieces of coax which are the same length and a tee connector. Yes, there might be a performance difference -- "power dividers" are likely to add unnecessary loss to the system, reducing your signal strength.

"Power dividers" aren't the right solution for any antenna phasing problem. See Chapter 8 of the _ARRL Antenna Book_ for more information. And feeding two elements or phased antennas with just two pieces of coax is usually more complicated than cutting them to the difference in phase angle, as explained in the _Antenna Book_ and http://eznec.com/Amateur/Articles/Simpfeed.pdf. But yours is a special case that's easy to do.

Hi Scott

That pair of 75 ohm transformers will work. I'd suggest that you
consider only 1/4 wavelength for the 70 ohm transformer in each line from
the 50 ohm Yagis. Additional transformer length will effect impedance
bandwidth.
I'd suggest using the "power dividers" unless $$cost is a consideration.

Jerry

If the antennas are to be spaced more than a 1/2 wavelength (free space), how can I use a 1/4 wavelength of 75 Ohm coax? I guess I would have to splice in a 1/2 wavelength multiple of 50 Ohm coax between the 75 ohm coax and the T connection to make up the length.

I only need about 500Khz of bandwidth, so this might not be a concern. But this was another question I was going to raise. Is there anyway to calculate the bandwidth that I would see from a 1/4 wavelength matching section? I guess that is a real easy one to test in real life though.

Thanks for all the responses!

Hi Art,

Does this cover your web page, using NEC, to describe a 6 inch element
as being resonant at 200 MHz?

No one needs
1. A text book;
2. NEC;
3. A computer;
4. A new theory
to simply put RF to that element and realize: it just ain't so.

basically nothing

Hi Art,

If you cannot explain why your work fails at the bench, I'm afraid you
are not going to find anyone to read theories with equal flaws.

Let's look at another difficult question:

You write at your web page that you have 3 elements with coordinates:
#1
-1.8421 3.0697 83.6493 -25.311 25.3112 82.7236

#2
-1.7146 7.636 79.6994 -15.45145 37.578 79.6994

#3
4.3792 2.528931 81.4985 3.9279 23.645 83.6096

You (not anyone else) show two of these as being orthogonal to the X
axis. A simple review of the numbers does not require:
1. A text book;
2. NEC;
3. A computer;
4. A new theory
to show that none of them are.

Hi Scott

If it is OK to assume the antenna's input impedance is close to 50 ohms.
Any length of 50 ohm line can be installed to a location where the 1/4 wave
transformers can be installed.
It may be confusion for me to add that I have connected two 50 ohm coaxes
in series to make them look like 100 ohms at the junction. I didnt think
the joining of coax center conductor to the outer conductor of another was a
good idea till I did it (after being advised by Mr Richard Clark).
Series-ing coax works quite well at 2 meters when a couple ferrite sleeves
are used to minimize currents on the outside of the shield. That allows
only one 75 ohm matching transformer (which isnt much of an advantage in
your case).

Jerry

Hi Art,

Anticipating you can't answer the last one about mechanical
orientation, let's examine your proficiency in using a computor with
this one element which in your words displays:
"Drive impedance of Element #1 equals
30.7 + j 0.1 ohms,
SWR = 1.01"

If we skip the modeling, once again simple bench work, not:
1. A text book;
2. NEC;
3. A computer;
4. A new theory
would reveal a SWR of 1.01 for a drive Z of 31 Ohms is a most curious
departure from convention - or did Gauss mandate a 31 Ohm system (you
certainly don't put this into your words).

The next error in light of this is (your words):
"Drive impedance of Element #2 equals
1121 + j 1554 ohms,
SWR = 3.65"

3.65:1 really? In the same 31 Ohm system? A new one for each
element? We need only look at the third example with nearly the same
mismatch, but a wildly different drive impedance to wonder from your
words that:
"Drive impedance of Element #3 equals
16.2 - j 22.4 ohms,
SWR = 3.64"

3.64:1 really? In what system are all these elements residing?

Is this in a place where the National Electrical Code applies (or some similar code)? Are you legally liable if it's done wrong?

If so, the answers to all your questions as to "requirements" are in the code. I've put some comments in below, but I've specifically avoided giving you required gauges of conductors, etc., because YOU need to go read the rules and figure it out.

>
> The antenna is in a 40" x 2" diameter nylon tube.

That's the radome over the antenna. The actual antenna is made of metal and is inside the radome.

It will be mounted
> using a standard A-frame type Channel Master side mount. A short piece
> of mast up from the two wall mounts to secure the antenna with U clamps.
> It will be up on the wall outside my office door maybe 10 feet.

The mast will need to be connected to the grounding system by an appropriate sized (as defined in the code) conductor. (in many cases, the coax shield can serve as the grounding conductor, so you might not need to run a separate wire)

>
> I have a gas discharge unit that comes with the antenna. It mates to the

> that leads through the wall to the wireless AP unit. There is a ground
> lug on the side of the discharge unit to attach a lead to.

Which the NEC requires you to connect to the building electrical safety grounding system in a particular way. (i.e. you can't just casually hook it up with any old wire to any old place).
>
> The building is on a hill so the AC units are all mounted on concrete

> and the usual vent pipes from the bathrooms. Power comes in from
> underground to a central location at one end of the building.

There is most likely a grounding point at the service entrance. That's
where you ultimately need to connect to. You can have other ground
connections too (depending on the situation) but all the grounds have to
be bonded together.

>
> The building is of wood construction with red brick facing. Shingled

> concern.
>
> 1) Do I simply go straight down into the ground below and will that
> create any arching issues with anything else in/on the building?

You can install an appropriate grounding electrode (i.e. rod) and ground
to that, BUT, you need to connect that rod to the building grounding
system with the appropriately sized conductor.
>
> 2) Is it better to bring the ground lead into the building and over
> to the circuit breaker panel for my office (a distance of about 40') and
> attach to the neutral wire at that point?

Under no circumstances should a electrical safety ground ever be
connected to the neutral, except at the one point where the groundING
conductor (aka "greenwire ground") is bonded to the the groundED
conductor (the neutral/white wire). (There are some weird exceptions,
but you're not in any of those situations)

If so, what guage wire for
> that distance is required?

Specified in the code. Distance doesn't enter into it.
>
> 3) There are probably some large electrical conduits just inside the
> wall (that supply power to nextdoor and upstairs) where my AP will be
> mounted. Can I attach the ground to one of these with a suitable clamp?

No. While conduit (metallic raceway in code-speak) can serve as the
grounding conductor for branch circuits (e.g. you can ground the third
pin in the receptacle that way), you can't "share" it with other
grounding needs. (and, besides, it's a bad practice for RFI reasons.)

Take a look at the "Low Voltage Handbook" on the Mike Holt website
(http://www.mikeholt.com/) It covers all the grounding and other code
requirements that apply to antennas and the like (including
interconnection of grounds, sizes of conductors, etc.)

Given the high cost of copper these days, you should seriously consider
using aluminum grounding wire. With the correct connectors, it works
great, and it's a lot cheaper and lighter weight.

By the way, there's lots of non-compliant installations of DBS dishes, WLAN access points, etc. around by, to be frank, hack workers who don't know or care. Just because the building hasn't burned down yet or no hardware been damaged or nobody has been killed, doesn't mean that it's an OK practice.

>
> Thanks for the help.

Good luck. It's not all that hard to do it right.

Oh yes, what was I thinking. From the antenna feedpoint, I can run two
equal length pieces of 50 ohm coax to the 1/4 wavelength matching
sections into the T connector - as you just said.

But it will be much more convenient for me to just use an entire run
of 75 Ohm coax, but as I said before, now you have me curious about
the effect on bandwidth - I will have a total of 1.75 wavelengths of
75 Ohm coax per leg.

Well, let's see. I have professional customers who use EZNEC daily to design complex antennas for commercial, military, and government use. On many occasions, they test the designs on a test range and find good correlation between EZNEC and measured results. This has been done over and over for a wide variety of antennas for years. Countless others have done the same with NEC and other NEC based programs. I have a standing request for anyone to report any difference in results between EZNEC and NEC, and so far have had zero responses except when the user accidentally made the models different.

On the other hand, I have you weaving your theories but without a single shred of evidence as far as I can see that the antennas you create have any advantage over any others, or even that they work as you claim. And for that matter, I find it nearly impossible to divine exactly what performance you *are* claiming for your creations.

So, should I check my program for accuracy because of your rambling conjectures? Certainly not!

Hi Scott

How much do you like Smith Charts?? It would be very easy to plot, for three frequencies, the impedance at the "far end" of the 75 ohm lines. That seems like a 5 minute job. Then you will know the amount of error introduced at the edges of your bandwidth. You'd know the impedance at the upper, mid and lower frequencies. It may be that a couple wavelengths of 75 ohm line may not introduce enough error to be concerned with.

Effective lightning protection is not trivial. It starts with an assessment of the risk, including whether or not your structure is effectively protected by nearby structures. The design of a protection system should be an integated design, what you do to your antenna may impact the other antennas / conductors / structures that are co-located.

Keep in mind that protection conductors may need to withstand typically 20,000A for 0.1s. The coax outer will probably not withstand that, so you must route the discharge to ground a different way.

The gas discharge unit is to limit the voltage rise on the inner conductor of the coax wrt the outer conductor. I think that it would be unusual that a gas discharge device would be effective unless / until the antenna / feedline was damaged, due to device's slow ionisation time and the rather small voltage with fast rise times that would be induced in a narrow band 2.4GHz antenna. It seems to me that your principle hazard is the current that will flow on the outer of the coax as a result of a direct or nearby strike, or the potential difference between your coax outer and the building earth system in the event of of a direct or nearby strike.

I know they sell these protection devices for the purpose, but I do wonder about their effectiveness.

Routing the discharge current effectively to ground is important, but equipotential bonding to avoid potential differences at critical interfaces is an important part of solution design.

So the first stage of the solution is to prevent most of the discharge current following the coax into the equipment room.

I agree with all that Jim Lux has offered you.

How do you guys model the parasitic effects of
a tower? With its base in concrete, it is neither
floating nor grounded. Is there some sort of
modeling rule for such?

For instance, if a vertical with sloping radials
is mounted on a tower with the radials insulated
from the tower, the tower still has an effect.
If we model the tower as mininec grounded, it has
some extreme effects which may not be realistic.

I know that some assert that a metal tower structure in concrete
foundations is effectively earthed for lightning protection, wouldn't you
also have some form of additional lightning protection that the RF effects
would be important to include in your model?

Use any lengths of 50-ohm coax, and then connect them using the
"combiner" or "power divider" of your choice.

In practice the divider/combiner will be simply a quarter-wave impedance
transformer associated with a T-piece. The 75-ohm coax version will
transform each leg from 50 to 100 ohms (ideally you'd need 70.7-ohm coax
for that) and then the T-piece connects those in parallel to give 50
ohms. Alternatively, you can use the type of divider/combiner that
directly parallels the two 50-ohm lines, and then transforms the
resulting 25-ohm impedance back up to 50 ohms through a quarter-wave of
home made 35-ohm hardline.

There's not a lot of practical difference between the two methods,
except that the first one requires you to cut and terminate two sets of
equal lengths of coax. The second one is easier electrically, but
requires some basic metalworking skills.

>I only need about 500Khz of bandwidth, so this might not be a concern.

If you need only 500kHz bandwidth at 144MHz, that will not be a concern.

I just saw the above, after having posted my first reply.

That wouldn't be a smart idea. Compared with either of the solutions
that uses only a single quarter-wavelength for the impedance
transformation, running two mismatched legs to 1.75 wavelengths will
increase the rate of change of phase with frequency by a factor of
1.75/0.25 = 7.

In that case, bandwidth might indeed become a problem, and phase
matching a big problem.

I have no additional lightning protection. I just want
to gather thoughts on modeling a concrete based tower
located within the fields of an antenna. Modeling it
connected to mininec ground just doesn't seem to provide
realistic results.

And, decide what exactly you're protecting against. Keeping the
building from catching fire is a very different goal than keeping your
AP alive.
>
> Keep in mind that protection conductors may need to withstand typically
> 20,000A for 0.1s. The coax outer will probably not withstand that, so you
> must route the discharge to ground a different way.

The usual NEC grounding is not designed to address actual direct hit
currents from lightning. It's more to deal with things like inadvertent
contact with an overhead power line, a short from power line to
something metal and then to your antenna, and, to a certain degree, to
induced voltages from nearby strokes.

The focus of NEC is "personnel safety" followed by "structure safety",
with "equipment preservation" being a very, very far distant third.
Likewise, the local regulatory regime is more concerned about you
getting hurt or starting your house on fire than whether your AP
survives. If you're interested in "equipment preservation" there's a
whole 'nother set of places to look for recommendations (the IEEE
Emerald book, IEEE-std-1100 is a good place to start, but pricey to buy.
Roland Standler's book on protecting electronics from overvoltage from
Dover press for $20 is another).

There are also various and sundry books and app notes from the sellers of protection equipment. They provide valuable information, and practical applications engineering data, but you DO need to bear in mind that they reflect that company's opinion of what the best way is. And that way generally uses their particular devices. (not of some money grubbing crassness, but because they have analyzed the problem, figured out a solution, and make the parts for that solution)

I'll be a bit glib here..

I wouldn't use mininec to model it, just because it doesn't do a good job for those sorts of things.

Hie thee to NEC4, which is specifically designed to deal with antennas near, on, touching, partially and fully immersed in the ground.

And even then, you can get bitten.

in practical terms, the impedance to "ground" of a concrete base is very low.. large contact area with the soil, reasonably good conductivity of the concrete itself (compared to soil, and especially compared to air).

if that level of subtle detail is important, you need some sort of Finite element or finite differences code.

When I want to assess the sensitivity with something like NEC, I start by just modeling the "widget" with a single wire, or maybe, a few wires. Then, see how much difference it makes to change that simplified model a bit (maybe move it a few inches or change the length a bit). if it doesn't make much difference, there's not much interaction, and the inaccuracy of the simple model will be small.

You're absolutely right. It's a weakness that I resist but sometimes succumb to in spite of my efforts. It's time to add Art to my very short plonk list so I won't waste any more time responding to him.

The sad thing is that I don't believe Art is a troll but rather is completely serious.

Bye, Art.

Wasn't mine..It was one they were using at a field day. As far as I
could
tell, it was a regular ole carolina windom, fed with their feedline. I
can't
remember if he had a tuner inline.
It was a dud though compared to a standard coax fed dipole.
A good 2 s units down on *everything*. "40m" Noise, desired signals,
the
whole ball of wax. Obvious feeder loss... Sure, you can make contacts
with such a device, but it's not for me.. Two S units difference is
about the equal of adding an average amplifier to a 100 watt radio.
I'm used to coax fed dipoles where the appx system efficiency is in
the
mid/upper 90's % range.. So almost any other compromise antenna is
going
to be inferior as far as total system loss. The main problem with the
carolina
windom I tried was the goofy feeder system with coax, choke, twin
lead,
etc... What a cluster%$#@ of engineering that is... :
If I'm going to use a compromise one wire/all band antenna, it's going
to be
fed with ladder line the whole way to a tuner which will be carefully
tuned using the least inductance possible. It will also be center fed.
Even that will be inferior to my usual coax fed... I've compared..
But usually my preferred multi band antenna will be paralled dipoles,
with the
legs spread apart as far as possible.. Fed with a single coax feed.
Thats what I use here at home. No loss in system efficiency compared
to many other multi band designs.

EZNEC works for me! It is an easy to use interface to NEC2.

I made my choice for the ARRL Antenna Course. Cebik does a good job of
teaching the pro's and con's of antenna modeling there.

EZNEC does not install an engineer or a genie in your PC but it does
provide a tool set that will save a lot of time and money with
realistic answers.

If you have something specific you feel a modeling package should do
please share it!

No, I think not... I get the impression that you will not like
any program that does not automatically spit out whatever it is
that you want it to.
BTW, I've tried some programs with "optimizers" etc, etc..
MMANA has one fer instance, and it's freeware.
In many cases, I can manually churn out a better design
by ignoring it, and doing it myself. I've seen a few churn out
some pretty funky designs which were not even close to being
optimum. Overall, I don't have much use for them. I don't need
the program to hold my hand while using it.

The bigger the vehicle, and the higher the mount, the lower the ground losses. But the type mount will effect also. IE: mounting directly on a roof will almost always be better than mounting on a ladder, with both at the same height. I've found that the more metal under the base of the antenna , the better. Mounting on a ladder, thin metal rail, angle iron, etc will usually result in inferior performance. But..Sometimes there is nothing you can do about it if the mounting options are limited. I ran into this on one of my trucks. At first I mounted the antenna on a piece of angle iron that ran across the truck bed, just behind the back window. Both ends were well grounded. But, I kept seeing overall lousy performance. So I decided to move it over on top of one the tool boxes, which has a good deal more metal area under the antenna base. Made a large difference, and woke the antenna up. That truck has a utility bed, and the boxes are pretty much part of the body. I'm not talking about a toolbox thrown into the back of the truck. Often those are not the greatest, unless very well grounded. I don't see why you need the exact ground loss. It's not going to effect your antenna design. But when doodling with vertical programs, I'll just stick in about 6-8 ohms as a "very good" mobile ground example.. A huge truck with the antenna on top could be slightly lower, but many small cars will be much higher. Knowing the exact loss is really not critical. Your antenna design will still come out the same.

The ARRL Antenna Book assumes ~10 ohms of ground loss
for mobile antennas. I've found that 12.5 ohms is the
lowest I can get for a 75m mobile antenna feedpoint.

What do Americans have to do with it?

From what I've seen there are at least some Canadians, plus a few others
that think you are a gibbering idiot.

> Again, you can't stop the advance of
> science just with bluster or piles of sand, sooner or later one has to
> decide what is the truth otherwise they are doomed to fall behind.

Raving nonsense.

Fall behind what?

What piles of sand?

> No
> one has provided a scientific response to what I state, nor is any one
> willing to prove to himself what happens when the computor program is
> actually tested and what should be done about it.

Maybe because you don't state anything, just ramble on, mostly incoherently.

I haven't the foggiest clue what your ramblings about computor (sic)
programs means.

> Why put yourself in
> the midst of such company who feel that derision is a good enough
> response to the advance of science?

What company, those that have very patiently, and several times, explained
what Gauss is all about?

Your ramblings remind me of my mother-in-law as she slipped into
dementia.

If that is your problem, I am truely sorry for you.

Thank you very much for the helpful info to my situation. The RV roof
is fibreglass. All I have to really work with is the ladder, which in
itself is bonded to the aluminum frame in the back walls, as well as very
well bonded to the chassis underneath by means of large copper straps.
Bout the best I can do. The figures you suggested should help too.
Thanks again.

Yes, but most mobiles are cars or pickups. Wouldn't you think that losses might be less on a large vehcle like an RV or truck, especially with such a high feedpoint as previously suggested (10 feet) ?

Ed

Hi Ed,

You've gotten several suggestions. 6-8 Ohms is no better than 10-12
Ohms as a guess; however, just what does this program do that this
number is so important in performing what it does?

Just out of curiosity, but can anybody inform me what's the problem between Art and Roy. In every posting of Art, Roy's name (or EZnec) shows up. Why not mention NecWin+ or Supernec or others ?

I don't know Roy, but when reading his postings I sure think he is a nice guy. When supplying answers on questions posted in this group, it's expectable he does some EZnec advertising, because it's a commercial product. Mostly he also takes the time to tell that there are other productys around with similar capabilities...

It's a pitty I was not aware of EZnec first few months after I stumbled over the Nec2 program.

:-(

Because a static field does not produce an EM field(curl) only if that
static charge is in motion. Motion would even include taking a charged body,
say a pith ball and waving it back and forth. Electrons have a static charge
but when they are in motion in a conductor they produce fields(curl).
Electrons moving about an atom also produces fields but the net result of
all the aoms moving about is zero. PLEASE REFERENCE THE GUASSIAN LAW ON
STATICS. I still think you are confusing static with statistics.

2300. Antenna optimizers

Can we start a new discussion, specifically about optimizers?

Having used Brian Beezley's YO and AO (Yagi Optimizer and Antenna Optimizer) extensively in the past, I'm not quite as pessimistic as Mark about the value of optimizers.

If they're simply allowed to run wild, they can produce some very foolish antenna designs. Usually that is not a criticism of the automated modeling... it mostly means that, for some practical reason or another, the user would be a fool to build the thing.

On the other hand, an optimizer can be very useful for tasks that have a very simple target, so it can't go far wrong. For example: "Adjust the length of that wire to make it resonant at this frequency." That doesn't take long to do by hand, but an optimizer can also handle more complicated tasks like: "Adjust the lengths of these three interacting wires to make the antenna resonant on three different bands." Then you really start to see some benefit from the automation.

At the other end of the spectrum is the kind of complex optimization for which YO was developed. You quickly learn that you can't just say "Optimize that yagi!" Quite the opposite: to use the program at all, you are forced to think very hard about what you really mean by "optimum" - for example, how much importance you attach to forward gain, a clean pattern, a convenient feedpoint impedance, and to maintaining that good performance over a wide bandwidth. Playing with an optimizer, you quickly come to understand that it isn't possible to get the best of everything, all at the same time... which is a very valuable lesson to learn.

The same applies to all other antenna optimizers, of course; and circuit optimizers too. The learning process alone can be worth the money.

Having gone through that learning process, an automatic optimizer can then zip out some really good antenna designs in a matter of minutes - which leaves you wondering what took you so long :-) But that isn't going to happen in the first evening, or even maybe the first month.

[Sorry, I don't know how or even if you can buy AO or YO any more.]

Because by the definition of "static field" nothing changes over time.

Art,

Adding the "metric of time" is exactly what J.C. Maxwell did, in 1865. The detailed hard work surrounding Maxwell's Equations, as we know them today, was probably more attributable to Oliver Heaviside. However, Maxwell gets the credit for adding the time contribution.

Yeah, like others have said, you'll need some fiberglass for that
band. As simple as it seems, its easy to get lured into a project like
that and end up spending more money than you would have if you just
bought it from a manufacter and you end up with something that isn't
as good. I went through this when building my quad. I always laughed
at the bamboo and shellac solution - even when Bill Orr wrote it.

Art wrote:
"These of course need to be avoided since they are based on the yagi being unbeaatable."

The Yagi in many ways is the first choice antenna.

It doesn`t increase windloading with conductors which add little to the gain. It doesn`t require more than one drivepoint.

Terman and Kraus liked it and document it.

In Arnold B. Bailey`s catalog of antennas in "TV and Other Receiving Antennas", no better array of simple wires, driven or parasitic, is to be found.

If Art can best the Yagi, he should post a comparison.

Best regards, Richard Harrison, KB5WZI

> the credit for adding the time contribution.

unfortunately art is stuck on one of the 4 equations and is ignoring all the
others. if he really understood maxwell's work he would know:

Gauss' Law is for static electric charges and fields.
Ampere's Law is for static magnetic fields, that is fields set up by
constant (read non-time varying) currents.
Faraday's Law introduced the time varying part of the relation between
magnetic fields and currents.
Then Maxwell tied them together with the displacement current into the 4
equations that we have been using and which have successfully been used to
calculate all kinds of electromagnetic phenomena for many years.

By talking about curl of electric fields art is forgetting that this is one
of the representations of Faraday's law:
curl(E)= -dB/dt (E and B are vectors of course) which automatically adds
the time relationship that he is trying to force into Gauss's law where it
has no place.

personally i recommend ignoring him until he goes back to fields and waves
101 and gets the equations straight.

The first time I used YO was on a 386 computer and I remember how
looooong it took. Not too long ago I ran it on my daugther's 3.2Ghz
computer and it zipped by so fast I couldnt see what was going on. Are
there new versions that take care of this timing problem? The hardest
thing to do when using this type of software is to define BEST. BEST
is a very subjective quality. For eample I had a vertical on 10 meters
that is 1.5wl long. Most people would call this an awful antenna with
a vertical radiation angle that is way too high. No doubt this wasnt
the best local antenna or the best DX antenna but it filled a niche.
It worked great for short range skip and allowed me to have QSOs that
I never would have had with any other antenna. Seemed to really like
to talk into Louisianna for some reason.

Is this babble supposed to mean something?

If something changes over time, it isn't static.

If it isn't static, static laws don't apply.

See Maxwell and friends for what applies when things are not static.

<snip rambling babble>

Babbling nonsense.

The existance of static particles (whatever the hell they are, I presume
you mean electrons) on the surface of a radiator has nothing to do with
applied energy (other than maybe wind energy).

> It departes from the SURFACE when energy is applied and continues to
> do so as time passes by in a time varying form until time stops where

More babbling nonsense.

EM waves depart when energy is applied, not particles.

Which, is, of course, the "sine qua non" for a *modeling* program.. it should take your model and tell you what the performance will be.

It does NOT give you any help as to where
> you could benefit in any way. When you move beyond the most

This is an "antenna designing" program. Many such programs will use one or more "antenna modeling" programs as part of their operation, although, it's not by any means universal.

The cost of these type programs are similar
> to eznec but can go up as high as a couple of thousand dollars
> tho most amateurs should be satisfied with the cheapest versions

"antenna design" is a fairly wide field, and people literally spend their life becoming good at one small part of it. There's a lot of judgement and skill in antenna design, particularly when it comes to things like mechanical/electrical tradeoffs and manufacturability. There are tools designed to address one niche or another (e.g. there's programs that are designed to optimize electrical performance microstrip patch arrays, there's programs that are designed to optimize Yagi-Udas, etc.)

Invariably, such tools are (at least originally) designed to be used by a person who will do the "higher level" trades (Do I use a rectangular or circular array of patches? What mechanical tolerances can I hold in manfuacturing? Can I hold a 5 meter by 4 meter array flat enough to actually work at Ka-band?)

There is some work on integrating all of these, but it's still baby steps (for instance, taking a Solidworks model and turning it into a meshed grid for modeling, or trying to integrate electrical, optical,

and mechanical models for large dishes (e.g. IMOS))

> Some programs are designed around the yagi only for simplification.

yes.. back before computers got cheap, people worked out clever analytical models for certain classes of antennas.. arrays of parallel straight thin elements would be one that's particularly amenable to such analysis. No surprise that as computers came to be more common, such models would be first ones to be implemented.
> These ofcourse need to be avoided since they are based on the
> yagi being unbeatable.

Not at all. it's that people had equations for Yagis (based on empirical experience that Yagis worked and met at least some of the requirements), and people tend to want to work with what is familiar. If for no other reason than you can compare the output of the modeling code (or the optimization code) with something you've actually built and see if it matches (aka validation).

So if a choice has to be made then programs
> with variable dimension abilities together with a sufficient large
> number of pulses are by far superior toi any other computor program.

Well, sure.. if you're going to any sort of Finite Element analysis (of which the method of moments methods are just one subset), more elements is better. But there's issues and concerns there, too: computational resources is one, roundoff and numerical precision is another. Start looking at models with hundreds of thousands of very tiny pieces, and it becomes quite the numerical analysis/computer science challenge to effectively compute it. And there are people working on it. I'm aware of several efforts to implement some MoM and FDTD codes on large (1000 processor) cluster computers. (say you want to simulate an entire ship, airplane, or spacecraft)
> None of these programs agree with each other because of built in
> errors

Error is the wrong word here (although technically correct), because it is perjorative and implies that there is a fundamental bug, which is generally not the case. All modeling codes are inaccurate to some degree, partly because of the limited fidelity of the model input (surely you don't want to spend the time to put in the actual atomic composition of the elements) and partly because of a deliberate tradeoff between speed and uncertainty (most people would rather have an answer in a few minutes accurate to 1% than an answer next week accurate to 0.01%)

> As a side point some programs provide errors because the user
> doesn't understand the thinking behind garbage in and garbage out
> because there is no oversight with respect to programmers error.

This is true of any modeling code. Better codes DO some reasonableness checks for nonphysical structures and such. But, just like using a chainsaw to saw down trees more rapidly than using a handsaw, there's some assumption that the user has some skill.

So, which is the real question:

1) Why do waves act like particles?

--OR--

2) Why do particles act like waves?

Sure. Coupling between the elements being they are so close
together, and inline with each other.
Thats why I spread mine apart as far as possible. The wider apart,
the less coupling in general.
If two dipoles are at right angles, they is almost zero coupling.
In such a case, I've had a leg of one of the dipoles fall down,
with little change in SWR for the other band being used.
Also the wider apart, the less skewing of the pattern from a
normal dipole pattern.
You can use the type antenna you describe, but tuning is tricky.
You have to start with the lowest band, get it tuned, and then
add the next higher band, get it tuned, and so on. Thats about
the only way you will get one tuned for each band.
And I've seen weird things happen with close coupling. I've
had cases where I would have to increase the length of the
legs on a higher band to go *up* the band. Pretty weird..
With them spaced as far apart as possible, you don't have
to go through all that tuning torture, and the antenna will
act more like a normal dipole for each band used.
I've used that system here at home for years. I change it
up quite a bit depending on season, etc..
Right now, it's a turnstile on 80m, and a dipole on 40.
At times, I'll have it 160,80,40 , and others 80/40/20..
Just depends what I'm doing at the time.

Like other quanta the photon has both wave and particle
properties, but has zero rest mass and is not a particle like
an electron

Well, in my book, they state it varied for the size vehicle. They
state as
low as 4-6 ohms, but I agree, thats kinda optimistic... :(
But it still really doesn't matter as far as designing the antenna.
It's going to be the same no matter what... And it's consideration
of current distribution, etc, etc, will be important.
My antenna design will be the same , no matter what the ground
loss. So I don't worry about it too much. I just accept what I get..
BTW, my book is getting a little old, "90's something" so maybe they
have changed that section.

> could you describe the antennas ?

Oui, bien s&#65533;r,

At the top you can see a parabolic dish (diameter 3.2 meters)

underneath a TH6, stacked with a Create DB18-24

underneath it's not a 4 elements yagi but 4 VHF antennas:
two phased 9 el yagi 144
and two phased 19 el yagi 435
rotatable site and az for sat tracking

On the right, you can see 6 whites points
the first 3 points are offset dishes (30 and 60 cm) for links on ATV 10 GHz
FM (transmitting)
the other 3 points are offset dishes (50 and 80 cm) for links on ATV 10 GHz
FM (receiving)

The links are:
with a repeater on Mont Aigoual (70 km)
with a repeater on Mont Ventoux (80 km) and montagne de Lure (120 km)
with a repeater in Marseille town (100 km)

underneath, near the shack, you can see a 5 elements yagi on 50 MHz and 2
small offsets on 10 Ghz for a link with F6BES 6 km away.

mobile.exe is a little DOS based program that gives you radiation efficiency, Q factor, etc, after you input several proposed design measurements of a mobile antenna. When calculating these antenna parameters for a "fixed station" type of mounting, (not on a vehicle, I guess), ground loss is one figure required for input. It is NOT a required input when figuring for mounting on a vehicle, I just realized.

I saw that. Neat idea, but as previously mentioned, I think, my needed antenna design is for 80M, operation only while stopped, must be vertical, and lastly, must not require me to climb up to the RV rooftop to put it up or take it down. I have a good idea where I'm going with this and will discuss the final product when it is completed ... probably several weeks from now.

What do you mean UNTRUE, Isnt it TRUE that you have repeatedly chastised people for only accepting that which is ACCEPTED and written in books, calling these people LEMMINGS. ISNT it also true you use the same software based on that long accepted data that you claim to be in error. Sounds to me as you want to have your cake and eat it too. Please explain how you can accept results from software that uses the theory you have denounced.

Has anyone thought of trying to use some of the ferrite beads to isolate the guy wires of a tower for RF so the tower could be shunt fed ? Along the same lines could the beads be used to electrically brake up the wires into non resonate lengths ?

yes, input selections are pretty much based on vehicle size; largest
vehicle choice is a Van type. Last choice is "fixed station" which I
assume means no vehicle at all.. and that is the only choice requiring a
ground loss entry. Since my proposed antenna is for an RV, it appears I
really needn't have asked the ground loss question at all!

mobile.exe is a rather neat little DOS program located on the CD in
the back of newer ARRL antenna books, I believe.... maybe in the Handbook
too, I'm not sure on that.

However, there are other optimizers out there. Arie has one in 4nec2 that works fairly well. There's also a program called GENOPT which can optimize ANYTHING (or at least, anything where the modeling program can be invoked from the command line and which takes a file as input and generates a file as output).. You can specify all sorts of contstraints and evaluation functions, and it just keeps shooting new models out, running the modeler, and parsing the output. For use with NEC, you need to write a little postprocessor to extract your desired "figure of merit" from the NEC output file (e.g. NEC doesn't give you something like F/B or SWR Bandwidth.. and while the GENOPT parser *could* be set up to do it, it would be painful...)

And, there's a variety of ways to do things like fire off NEC from Excel, and you can use Excel's optimizer (such as it is..).

If you get into more esoteric optimizers like particle swarm or genetic optimizers, they're all available in fairly generic form.

So, what you need is the following 4 pieces of software:

1) The optimizer engine
2) Something that takes a list of "parameters being optimized" (your independent variables) and turns it into a suitable model file
3) The modeler (e.g. NEC)
4) Something that post processes the output of the modeler to generate your "evaluation function".

If you can get each of the latter 3 in a form which is invokable from the command line, then almost all of the existing #1 programs can use it.

For doing #2, there is a perl script/program out there that can do fairly nice parameter substitution. Not quite as nice as Arie's 4nec2 symbol substitution with math, but at least it will take a file with one parameter per line, and substitute them into a "skeleton" NEC input deck that has parameter references, with some arithmetic. There's actually a lot of these sorts of scripting tools around.

for #3, it exists already

for #4, it would be nice if there were a library of little programs that could parse a NEC output deck and just emit a few numbers for some standardized analyses.. For instance, you could feed in a NEC output file and it would give you front/back ratio, or SWR bandwidth. Obviously, such things exist, embedded in programs like EZNEC and 4nec2, but they're not readily available as little usable components (and I

don't expect Roy or Arie to provide them, either.. That's their proprietary improvements on the raw NEC engine, and they should use them as they see fit, in exchange for the considerable work they've put into it.)

Maybe a good start would be to define some common "figure of merit" numbers that might be applied to antennas. Not just define in words, but in a more rigorous quantitative specification sort of way. Some are easy (forward gain, swr bandwidth for a single band), some are more difficult.. how do you handle describing side/back lobe performance? Do you cutoff above a certain elevation angle (on the basis that there's no propagation there anyway)? The radar folks talk about things like Peak Sidelobe Level, Integrated Sidelobe Level, and average sidelobe level.

Uhh.. I think Arie is doing what he can. Have YOU downloaded 4nec2 and taken the time to learn how to use it and loaded your model in and run it? It's your design, and YOU should put the work into verifying it. Sure, you might have to figure out how to convert your conceptual design into a format amenable for 4nec2 (or EZNEC or any of the other modeling/optimizing codes). But this is something that any antenna designer has to do. The program is just a tool. You have to invest the effort in effectively using the tool, or deciding whether it's an appropriate tool to use for answering YOUR questions.

It's not like Arie should do this as a demo, just to convince you to download a FREE program. If you were a large company that was contemplating spending $60K on a big modeling code, it might be reasonable to ask the vendor of the code to run a sample model to see if you've got a handle on the interfaces, etc. But the vendor's work in that case fits in the category of "marketing expenses".

And, it's not real clear what the question is that you expect to have answered by 4nec2 or AO, or whatever.

As far as the source of what Arie has done... I have NO first hand knowledge other than observing the changes it's gone through over the years. I'm pretty sure it does NOT use the same optimizers or optimization method as AO. For that matter, his optimizers have evolved over the years as new optimization algorithms come along.

And, on a more philosophical note.. it's pretty darn offensive to allege that Arie's merely copied someone else's work, especially since Brian's codes haven't ever been published as source code, to my knowledge. Arie's put a lot of work into this, and is being quite gracious in giving to us to use for free.

You see it every day; it is called light.

Photons are not particles because they have no rest mass; particles
by definition do.

If photons had mass, they couldn't travel at the speed of light.

Or didn't you know that nothing with mass can travel at the speed of
light?

At one of the CA 75m shootouts, Sanford, W6YY had
a motorized 30 foot vertical mounted on top of his
huge RV. While he was traveling, it laid down against
the top of the RV. When he was stopped, he had it
motorized so he could raise it to a vertical position.
He beat the best of the best 75m mobile bugcatchers
and screwdrivers by 2 dB and beat a 75m hamstick
by about 14 dB. It's certainly worth considering.

The most effective ferrites are primarily resistive
thus dissipating some power. Maybe a more reactive
ferrite might work better?

The inductance of a piece of wire passing through a ferrite bead would be way
too low to produce a discernible choking effect at HF frequencies.

It's old hat knowledge, John, and one of the reasons
why standing wave energy doesn't just stand there or
just "slosh around" as one guru asserted. If a photon
is slowed to zero velocity, its mass vanishes and
it ceases to be detectable. A photon's mass derives
from its speed-of-light velocity, i.e. it is 100%
kinetic. Any particle with a resting mass would necessarily
have infinite mass at the speed of light. Therefore, any
particle with a finite mass at the speed of light must
necessarily have a zero rest mass.

It would require multiple beads at each point, and at multiple points.
While it could be made to work, it would be heavy and expensive. That's
why egg insulators or non-conductive guys are used instead.

Thanks for the kind words, something too seldom seen here lately.

Long ago, I told Art that I and some others wouldn't pay much attention to his conjectures unless he posted some quantitative results showing how his antenna creations were better than any others. He interpreted this as an attack, and that slowly turned to the hatred you now see. He dislikes EZNEC, I believe, simply because it's my program. I've eventually become the personification of the cartel which is out to belittle and deride him, preventing him from achieving the recognition he believes he deserves for his revolutionary insights. I'm in no way a qualified psychologist, but I see a number of similarities between this and the behavior shown some time ago by Nathan "Chip" Cohen (Fractenna"), who also considers me to be evil incarnate for much the same reason. As far as I know, these are the only two people in the entire world who dislike me this much. I'm afraid that by saying complimentary things about me, you -- and by association, your program -- will be joining me on Art's hate list.

I'm sorry to see that some of my postings and comments about EZNEC are regarded by anyone as advertising, since I don't believe that advertising is appropriate here. I do naturally use EZNEC as an example or suggestion when giving an example of how to model something or to illustrate a point and frequently recommend the free demo, but I don't believe I've ever suggested that anyone buy EZNEC or that it's necessarily superior to any other program. In fact, I often give tips on using NEC-2. I also post corrections when someone says something about EZNEC's capabilities which isn't true, and to answer questions about it. I invite anyone who considers what I say about EZNEC to be out of line to comment -- I'll certainly try to change my level of commentary if there's general agreement that I've been advertising.

> the credit for adding the time contribution.

unfortunately art is stuck on one of the 4 equations and is ignoring all the
others. if he really understood maxwell's work he would know:

Gauss' Law is for static electric charges and fields.
Ampere's Law is for static magnetic fields, that is fields set up by
constant (read non-time varying) currents.
Faraday's Law introduced the time varying part of the relation between
magnetic fields and currents.
Then Maxwell tied them together with the displacement current into the 4
equations that we have been using and which have successfully been used to
calculate all kinds of electromagnetic phenomena for many years.

By talking about curl of electric fields art is forgetting that this is one
of the representations of Faraday's law:
curl(E)= -dB/dt (E and B are vectors of course) which automatically adds
the time relationship that he is trying to force into Gauss's law where it
has no place.

personally i recommend ignoring him until he goes back to fields and waves
101 and gets the equations straight.

I never tire of semantic humor. A double meaning or,
even better, a triple meaning, is one of the things
that makes English so enjoyable. (And I really enjoy
the "wench for sell" over on rec.radio.swap.)

But seriously, QED indicates that everything that
exists is a particle, even if it has no rest mass,
even if it is only virtual.

Owen,

Just returned from five days in Jacksonville, FL for spinal surgery that didn't occur. I had cataract surgery on Feb 20, and the spinal surgeon said I needed six weeks of recovery from the earlier surgery before he'd perform the spinal, for fear of damaging the yet unhealed eye. So now I can get back to business as usual for a while.

I'm familiar with the Maximum Power Transfer Theorem that appears in Everitt's 'Communication Engineering', but not with Jacobi's. Is there a difference in their definitions?

I still believe that the 1400 ohms appearing in my paper you reviewed is the average of the dynamic resistance of the source, because the maximum power available for the given drive level, i.e., the 'available' power, was being delivered when the input resistance of the pi-network was 1400 ohms, while less than the available power was delivered when the input resistance of the network was either greater or less than 1400 ohms. This condition conforms to the Maximum Power Transfer Theorem as I understand it.

>why other tests disagree.

Owen, you wouldn't believe the sensitivity of these measurements unless you tried them.

First, measuring voltages v1 and v2 with an analog voltmeter just won't cut it. A VM with digital readout is essential, and it must be precise to 0.1 v. Because the delta current in the denominator is so small, even an error of 0.2 v skews the result.

Second, reading the voltage at each load requires a few seconds for the voltage and current to stabilize, and then the readings must be taken while the voltage and current are stabile for at least two to three seconds. You'd be surprised how unstable the voltage is at the 0.1 v measurement level. Even so, many readings must be taken, first the reference, then the load, then average out the readings.

Third, consider the breadth of the slope of the power vs load resistance curve at the peak power point--it is broad! For example, a load resistance of +/- 10% of the source resistance, say 55 or 45 ohms, yields a 1.11111 mismatch to the source, for a reflection coefficient of 0.053, for a power loss of only 0.012 dB. When trying to adjust the amp loading for maximum delivery of power using an analog meter, it's impossible to observe a change of 0.01 dB, thus when one

appears to have loaded for maximum, the source resistance can be anywhere between 45 and 55 ohms and you'd never know just what it is. Thus, it's practically impossible to achieve a perfect conjugate match in practice, but you could. On the other hand, though not a perfect conjugate match, you'll have a practical conjugate match, because the difference in power delivered is insignificant. What I'm trying to convey is that a conjugate match is possible, though difficult to achieve when loading the xmtr.

Consequently, I can appreciate why others have obtained results different from mine, unless they have taken the necessary steps to overcome the sensitivity problem of the small current number in the denominator of the load-variation equation.

>
>(It only takes one sound repeatable experiment that shows that the source

>rough, they indicated different apparent source impedance at different
>drive levels which questions the linear model for large signal operation,
>especially for modes with varying amplitude such as SSB telephony.
>
>Owen

I should have mentioned above that all of my measurements that determined a particular source resistance were taken with constant drive level, If source-resistance measurements are taken at any one drive level, the observed source resistance will be equal to the load resistance if all available power was delivered during the measurements. But if the drive level is changed without readjusting the loading, the source resistance will also have changed. However, I have found that for any given drive level, the measured source resistance will equal the load resistance if the loading is adjusted so that all the power available for that drive level is being delivered.

Just to be sure we're on the same page, let me define my understanding of 'maximum' power and 'available' power. For any given drive level there is a maximum of power that can be delivered. I call that the 'available' power. I consider 'maximum' power to be that which can be obtained by overloading a tube with excessive voltage or current relative to the manufacturer's ratings.

Cecil:

I know that is argued, and I suspect it all hogwash.

If "they" have to create theories depending on disappearing particles,
when you get one where you can take a look at one of them dern
"particles", that is just TOO desperate.

However, it does, in my personal opinion, suggest a STRONG relationship
of the "particles" to the ether--the ether cannot be seen nor detected
either ... (that is, IF it really exists, as I suspect it does ...)

Computer modeling seems to be the new shill game of street smart con men
alright.

However, I think antenna modeling software is in a bit different
category--however, the computer model can only be as good as our
understanding of "radio theory." (and note, that IS radio theory and
NOT "radio laws."

Yes Ralph, beads could be used to achieve what you want. I refer you to a paper that will appear in Reflections 3 as Chapter 21A, which is a continuation of Chapter 21 in Reflections 1 and 2. Chapter 21 tells of the need for a balun, and how the beads perform as a balun.

However, Chapter 21A describes how I developed the idea for using beads for the W2DU balun. The idea came as a spin-off from a method I used during radiation-pattern measurements for the antennas that flew on TIROS weather satellites. The downlead for the signal received from the antennas on the satellite was reradiating EM energy, and distorting the radiation patterns. I reasoned that placing a bead every quarterwavelength along the downlead would breakup the current on the lead, which it did. I then transformed the idea into the W2DU balun, which is described in all editions of the ARRL Handbook since around 1985. Chapter 21 is a repeat of my article in QST for March 1983.

Chapters 21 and 21A can be found for downloading on my web page at www.w2du.com. Click separately on 'View Chapters from Reflections 2' for Chapter 21, and click on 'Preview Chapters from Reflections 3' for Chapter 21A.

Hope this helps.

Hi Ed,

Doesn't sound worth the clock cycles to run it when a Magic 8-Ball
would be just as accurate.

You can get better results from the free version of EZNEC because you
know what you've put in and what relationship it has to the whole. If
you belly up to the bar and buy the full-blown version, then you can
design a model of your antenna, RV, ladder and frame.

Definitions of "scientific theory" on the Web:

* An explanation of why and how a specific natural phenomenon
occurs. A lot of hypotheses are based on theories. In turn, theories may
be redefined as new hypotheses are tested. Examples of theories:
Newtoni¿½s Theory of Gravitation, Darwini¿½s Theory of Evolution, Mendeli¿½s
theory of Inheritance, Einsteini¿½s Theory of Relativity.
www.ncsu.edu/labwrite/res/res-glossary.html

* A hypothesis that is widely accepted by the scientific community.
www.ametsoc.org/amsedu/WES/glossary.html

* a statement that postulates ordered relationships among natural
phenomena.
farahsouth.cgu.edu/dictionary/

* The most logical explanation of why things work the way they do.
A theory is a former hypothesis that has been tested with repeated
experiments and observations and found always to work.
jmsscienceweb.tripod.com/vocabulary.htm

* A body of knowledge using controlled-variable experimental
methods to construct a formal and mathematically structured system. It
studies the character of natural reality. Scientific Management (6).
System of management popular in the first decades of the 20th c.
Proponants sought to transform industry, government and society through
greater efficiency. Utilizes top-down approach.
www.udmercy.edu/faculty_pages/staudenmaier_sj/ethics/glossary.html

* a theory that explains scientific observations; "scientific
theories must be falsifiable"
wordnet.princeton.edu/perl/webwn

* The word theory has a number distinct meanings depending on the
context.
en.wikipedia.org/wiki/Scientific_theory

>Gauss' Law is for static electric charges and fields.

It is usually used for problems in electrostatics, but it is not
confined to such problems. The differential form of it is just one of
the Maxwell equations:

div E(x,t) = 4\pi\rho(x,t)

Integrate it over a fixed surface and you get the integral form, which
is Gauss's law. It is valid with time-dependent charge densities and
time-dependent electric fields.

That isn't quite true. The big gap is between anything we'd normally call "light", and anything we'd normally call "RF".

Long explanation coming up... Executive Summary: at normal radio frequencies, quantum theory is totally irrelevant.

Quantum theory describes electromagnetic energy as being divided into a series of packets called photons, so (total energy in a stream of photons) = (number of photons/second) x (energy of individual photons).

This also means that EM energy doesn't exist in pure sine-waves - the waveform is actually built up in steps, very much like digitized audio. The step size is the energy content of one quantum.

The question is: are those steps noticeable enough to be important?

For light and shorter wavelengths, the answer is often Yes. Quantum theory was developed to explain observations like some kinds of light being emitted in a series of sharp spectral lines, which cannot be explained by a wave-only theory. Instead, it has to be thought of as being built up of individual photons/quanta which can only have certain "allowed" energy levels.

It turned out that the energy content of a single photon is uniquely related to the wavelength of the radiation. Any given wavelength has only one quantum energy. More energy can only be made up from larger numbers of the same identical quanta. That unique quantum energy is

inversely proportional to the wavelength, and directly proportional to the frequency:

E = hf

where
E is the energy content of a single quantum/photon (joules),
f is in Hz
h is Planck's constant which has a value of 6.6 x 10^-34 joule seconds.

This applies to all forms of EM energy, so let's calculate the 'step size' in an RF waveform at 10MHz. That will be the energy content of a single quantum, which turns out to be 0.000 000 000 000 000 000 000 000 0066 joules - which is unimaginably small.

It means that an RF waveform must be quantized into unimaginably large numbers of tiny steps. Those steps will NEVER be observable, and there will NEVER be any noticeable quantum effects at RF.

That holds true for all frequencies up to at least 100 gigahertz (millimetre wavelengths), where quantum effects just begin to be noticeable in precision measurements of very low noise levels - but even way up there, quantum effects are still only a small correction.

So after all that, we come back to the plain fact that normal RF radiation behaves purely as waves, just like we always thought it did. The only new information from quantum theory is to *confirm* that classical EM theory is all you'll ever need.

While in a balun a reactance of say 1000 ohm would be more than adequate for the purpose of avoiding radiation (or reception) by common-mode currents, in the proposed application (guy-wires) a much higher reactance would be required. As a matter of fact at the top of the tower, where there is a voltage peak, the impedance is very high, and the guy-wire insulator (either an egg or ferrite beads) should then show a very high reactance value (probably in the region of tens of thousands of ohm) not to disturb the antenna.

I never played with ferrite beads, but I have a rather strong feeling that such high reactance values are hard to obtain at 3.5 MHz just using beads.

no, i'm afraid you can't just put a 't' on each side and have it make sense
in the general case. time varying charge implies a current, a current
implies a magnetic field, then you have to include Ampere's law and add
curl(E)=-dB/dt to the mix. while you may be able to constrain the changes
in rho(t) to some short time or constant current and eliminate the dB/dt
part of the problem, that would only apply in specific conditions, not to
the general case.

In a free space vacuum, they all behave
essentially the same way. Their different
quantum energy levels causes them to interact
differently with the atomic structure of matter.

At 1 MHz, a photon has an energy level of
4x10^-9 eV while a gamma ray photon might have
an energy level of 4x10^+9 eV or higher.

Algore and socialist liberal leaches looking for new "crisis" so they can justify and fool sheeple into submitting to crazy measures and spending money.

Any ham knows that we are on the mercy of Ol Sun which supplies us with warmth and light and has its moods, periods and we can't do a shing about it.

Hey Algore! See the temperature differences day/night, summer/winter? What causes it? CO2 or Sun's generosity?

Global Scam of all times. Not even antenna optimizers or Gausian gizmos can do a thing about it. As soon as Algore got his Ossskar, God blew wave of cold to show him who is in charge :-)

73 and keep breathing out CO2 and step on the gas of your SUV, plants love it!

Yuri, K3BU.us

Maybe 40 nano-eV is more imaginable? :-)
For me, it is a lot easier to visualize a cloud
of photons leaving an antenna than it is to visualize
the field lines closing upon themselves (like a soap
bubble) and breaking free of the antenna.

Incidentally, your above number is off by 0.3% :-)

he may have hit what you believe correctly.. but unfortunately it is not a
valid generalization. as i stated in my other message:

no, i'm afraid you can't just put a 't' on each side and have it make sense
in the general case. time varying charge implies a current, a current

implies a magnetic field, then you have to include Ampere's law and add curl(E)=-dB/dt to the mix. while you may be able to constrain the changes in rho(t) to some short time or constant current and eliminate the dB/dt part of the problem, that would only apply in specific conditions, not to the general case.

So, do I get you right here?

Like a high power hunting rifle, the energy that the photon is "shot"
from the antenna at guarantees a far and straight course of projection
(at vhf+ freqs)--as opposed to the lowly bb gun where the bb with low
energy is forced to fall to the forces of gravity (on in the photons
case, the earths magnetosphere) and come to earth much sooner?

The above is meant to be a bit "humorous", but you are stating HF is
much more prone to obey magnetic forces in the magnetosphere as opposed
to high freqs where photons are endowed with much more "kinetic energy"
in the form of the voltage(E) charge they have?

Since the law of conservation of energy exists, I am assuming you
consider some relationship of E/I to have changed in the VHF photon as
opposed to the HF photon--since there is no way for the 5 watts HF to
have different power levels than 5 watts VHF?

Roy, Be assured that I do not hate anybody. That sort of emotion
is of no use. What I do abhor is disrespect and arrogance even though
my actions seam to invite it and apparently I have little control over
because of my personal circumstance. However as the
perceived leader of this group what you may see as a mild rebuke
is instantly latched onto by Richard who with his cfontinuing carping
spreads his arrogance and disrespect to others and it becomes
infectious to where I have no option to return in kind.
True one person scolded him for what he was doing and I thank him
(There for the grace of God go I, was the theme)
I am an Englishman and we don't run away from a fight if one is to
start. But now a new person has arrived on the scene who has an
understanding of what I have failed to project, thus you have a
different person to approach other than I for a deeper understanding
to your satisfaction. Hopefully this will put all the mutual
disrespect and abuse behind us and allow us to enjoy a new day.
I ask all to have respect for this new person for having the courage
to come forward inspite of what appeared as a hostile audience. I too
hope to learn from what he has to say as we now push the past aside.
Let me assure you that this is a new day for amature antennas and if
you wish to pursue then get hiold of AO or AOP from Brian Beasely
possibly being sent via the net. It is the only form that I am
presently aware of that allows pursuit of this subject and it is very
reasonably priced if he decides to re release it. Perhaps Brian will
come up on this thread and give details of contact issues

you obviously have not read and understood my recent posts. when you do
curl of electric fields you get ampere's law which takes into account the
time varying electric field... but of course also brings in the magnetic
field that is related to it. unless you add that part into the equation you
are ignoring half of the effects and will never get the proper understanding
of the equations. simply adding time to gauss's equation, written either in
differential or integral form simply ignores the magnetic field part and the
effects of curl and the resulting field and wave propagation effects that
must be taken into account when you start talking about time varying fields.

Not exactly. All photons, regardless of energy content,
travel at the speed of light (modified by VF, of course).
Your above example assumes most of the difference in energy
level is associated with the square of different velocities.

Five joules of HF (10 MHz) requires ten times as many
photons as five joules of VHF (100 MHz). What HF photons
lack in energy, they make up for in quantity.

I get ~7.553x10^28 photons in 5 joules of 10 MHz RF
energy and ~7.553x10^27 photons in 5 joules of 100
MHz RF energy.

The E-field/B-field ratio is the same for both in
free space.

Jibber jabber, jibber jabber... Why don't you just build one and test
it..
Why do you need to prove anything to us? Myself, I have no interest
in such an antenna, and almost surely never will. So unless you build
one and test it, it's unlikely to ever get done around these parts.
Well, unless you can talk some poor sucker into doing the work for
you.
This is starting to remind me of an old TV show called "Peyton
Place"..
Maybe it's time for a new 2007 version called "Gaussian Place"... :(
In the new updated program, all cats have mittens.

Like I said, my original post in response to you was just "a joke", of course the velocity of all photons is assumed constant.

However, the fact we fire a shotguy (HF) or a single bullet (VHF) makes the photons in HF assume different charastistics than that of the fewer photons of VHF?

I mean, I may be rather dense here, but I am attempting to put the model you are presenting here together--obviously, I am missing something ...

I encourage you to review the Maxwell equations in a book on
electrodynamics. I personally like the book by Jackson, which is
oriented more towards physicists. In any case, the equation that I
wrote is one of the 4 Maxwell equations. It is valid for arbitrary
time-dependent electric fields. All it says is that the divergence of
the electric field at a point is proportional to the charge density at
that point:

div E(x,t) = 4\pi\rho(x,t) (Gaussian Units)

If you integrate this over a closed surface, and then use the
divergence theorem you get

\integral dA.E(x,t) = 4\pi \integral dV \rho(x,t)

The integral on the right-hand side is 4\pi times the total
(time-varying) charge enclosed by the surface. The other equations
are also valid, including the one you wrote.

Coincidently earlier this morning I was reviewing the derivation of
the energy loss of a heavy charged particle as it passes through
matter. The derivation made use of a very long cylinder with the
charged particle traveling along the axis of the cylinder. One point
in the calculation required the integral of the normal component
electric field (dA.E) produced by the charged particle over the
surface of the cylinder. That is, the left hand side of the above
equation. The answer is given by the right hand side of the above
equation. In this case, the charge density \rho(x,t) was created by
the moving charged particle.

Maybe cause and effect? Cause and effect is indeed
missing in a lot of QED stuff. Not only do some
virtual particles move faster than the speed of
light but also apparently necessarily jump
backwards in time.

So-called Feynman diagrams represent antimatter particles (positrons,
anti-quarks, etc) as the corresponding "matter" particles going
backward in time. Of course no physicist actually takes this
interpretation seriously. Nor do I believe particle theorists take
virtual particles seriously. They are just a convenient
representation of the terms in a perturbation expansion. It is unclear
to me that virtual particles play a role in non-perturbative theories.

Gauss's law in Jackson's 'Classical Electrodynamics' 2nd edition, ppg 30-32,33 has NO 't'. nor does it in Ramo-Whinnery-VanDuzer 'Fields and Waves in Communications Electronics' ppg 70-72(differential form), 75-76(integral form)

your final statement means that you are obviously outside the applicability of Gauss's law since you have a moving charged particle, which can not be described by a static field. i would guess that whatever derivation you are looking at placed some other restrictions on the conditions such that you could approximate the field by that type of equation. possibly a small velocity or short distance or very short time period.

This is not surprising since that chapter in Jackson deals with
electrostatics. Look at section 1.5 on page 17. The section states:

The Maxwell equations are differential equations applying locally
at each point in space-time (x,t). By means of the divergence
theorem and Stoke's theorem they can be cast in integral form. [...
a few sentences later...] Then the divergence theorem applied to
the first and last [Maxwell] equations yields the integral
statements... The first is just Gauss's law...

Actually, you can't get a lot of reactance from ferrite cores at HF. You can get a considerable amount of impedance, but for the ferrite types which provide it, the impedance is largely resistive, not reactive. The most common material, Fair-Rite type 43 and equivalents, has a Q of 1 (R = X) at a frequency of a few MHz, and is increasingly resistive above that. But even with the highest impedance materials, you'll likely need quite a few cores with substantial cross section at each location. Anyone interested in ferrite impedance properties can visit the Fair-Rite web site to learn more.

A choke at a high-impedance point doesn't do much, since there's no substantial current at that location to block. You should put the choke about a quarter wavelength from there where the current is nominally high. The presence of the choke can move the locations of high and low voltage and current points, so you'll need a choke at least about every quarter wavelength to make sure there's no point where substantial current can occur.

Others have pointed out that ferrite chokes might be a viable way of effecting RF isolation on conductors carrying low frequency AC, such as power lines. But I maintain that it's not a good solution for guy wires, which was the subject of the original posting.

Is there a nominal impedance or approximate impedance for a loop antenna? For example, a dipole is considered 72-ohm, a bevarage 450-ohm. What is a nominal loops Z?

I have a 4-1/2 foot diameter loop antenna with 12 turns paralled by a capacitor for the antenna and one additional turn for the pickup coil. The loop is for the 200 - 500kHz band. About how much is the impedance of such an antenna? Thanks.

Al

Energy is not expressed with a time in the denominator. The standard
quantum theory expression for energy is eV - time is wholly absent as
it should be.

>This also means that EM energy doesn't exist in pure sine-waves

EM theory does not exclude the classic description of pure sine waves.
This is not a neither/nor situation.

> - the
>waveform is actually built up in steps, very much like digitized audio.

This appears to be the beginnings of a description about to fall off
the edge. What waveform? This is a conceit of time.

>The step size is the energy content of one quantum.

No, the step size as you describe is the potential difference of
quantization, an engineering term, not a quantum mechanics term. It
is quantisizing an amplitude to construct the wave in a time domain.
Quanta is the complete wave in a frequency domain.

The transform from one domain to the other is classic Fourier. His
analysis revealed that one unique energy (a single frequency) can be
decimated into many components (amplitudes over time). The
transformation is fully reversible (many amplitudes over time turned
back into one single frequency) without any information loss.

Mixing the two as being one analysis, corrupts it. Time is not a
factor in energy and cannot be drawn into its discussion through
transforms that mix topics.

>The question is: are those steps noticeable enough to be important?
>
>For light and shorter wavelengths, the answer is often Yes. Quantum
>theory was developed to explain observations like some kinds of light
>being emitted in a series of sharp spectral lines, which cannot be
>explained by a wave-only theory. Instead, it has to be thought of as
>being built up of individual photons/quanta which can only have certain
>"allowed" energy levels.

There is absolutely no distinction between "allowed" energy levels and resonance which allows only certain frequencies. Resonance has been historically correlated with circularity, and every instance you site above is found in the change of orbitals - circular, harmonic motion.

A photon is emitted in the cM band when an electron orbiting a Hydrogen atom flips its magnetic pole. This event is vastly below the short wavelengths you describe by a million-fold. A good number of correspondents here are fully capable of detecting this event with commercial gear already suitable for the Ham market. They could have done it 50 years ago too.

This is a quantum event, it is expressed with a classic quantum energy, and it is resolvable as being important (insofar as "importance" is a subjective, not quantitative quality). It is certainly noticeable and is not artificially constrained by scale.

yes, referring to all 4 Maxwell equations you do have a 't' dependency.
however, even equations 1.13 and 1.14 referred to by your quote have NO time
dependency in them. the equations on the next page,1.15 and 1.16 have the
time dependency that the 't' in your quote refers to. remember, those
integrals are NOT integrals over time, they are over the surface or volume.

probably a few tenths of an ohm. a full wave single turn loop is about 100
ohms, but very small loops have very small impedances. the reason for the
pickup coil was probably to act as a transformer to bring the impedance seen
by the receiver to a reasonable level.

>the addition of time in relation to antenna's?.

Hi Derek,

Actually, that question has to be parsed for Art's sake for
immortality. Gauss's laws were altered to accommodate the addition of
time.

Gauss didn't do it, so Art is smarter than Gauss (because Gauss is
dead).

Maxwell took Gauss's work (and some dead Brit's) and did it, but he
didn't think of it in relation to antennas (there were none). So Art
is smarter than Maxwell (because Maxwell and some Brit are dead).

Marconi took Maxwell's addition of time to Gauss's (and some dead
Brit's) work and put it to antennas, but he didn't write a book about
it. So Art is smarter than Marconi (because Marconi is dead).

Bellini and Tosi took Marconi's work derived from Maxwell (and some
dead Brit) and Gauss's and did it, and wrote a book about it. Art can
ignore that because it is in an American book. So Art is smarter than
Bellini and Tosi (because, they too are dead).

He still has a lot more to rush into the grave. He is beginning to
stack them like cord wood. Did you bring your own head stone?

Al,

What is a nominal loop?

Though there will no doubt be some instant answers to your question, the information you have provided does not allow calculation, anything else is a guess.

The impedance (if you need to know it) is probably easiest found by measurement, and it will probably vary with frequency even though you resonate it at each frequency (assuming the capacitor you describe is variable).

Hi Art,

If you are suffering from dehydration, it will have been from all the spitting on me. ;-)

Is it that painful for you to explain how identical radiators you describe as all being resonant at 200 MHz exhibit nearly 20:1 variation in drive point Z? This is something that doesn't require a book, a theory, or a new computor to test. It can be done with a transmitter and a SWR meter - if you have them.

If curling can't explain this, would it shame Gauss to have to go to the bench?

Roy, NEC models suggest that lossy chokes (eg suppression sleeves or cores where Q is very small) don't modify the current distribution much unless they are of sufficiently large impedance, and that introduction of low Z chokes just introduces another loss without much impact on the current distribution or resultant antenna pattern.

The magnitude of Z needed to be effective in forcing a current minimum at a point might be quite impractical to implement using suppression sleeves, so the time honoured insulator looks the better solution.

Hello Jim:

I appreciate the detailed reply and I have printed out the Low Voltage Handbook and will read it over this weekend.

When I started doing research I found this web site for dish installations. Can you comment on what it describes as the "5 suitable grounding locations". They seem to indicate that you can use an electrical panel and or the "raceway" as a ground. I'm confused.

<http://www.dbsinstall.com/whatis/Whatisgood-5.htm>

Also, why is there a mention for separate grounding of the mast and the coax?

Do I need to provide one ground for the mounting pipe (mast) that secures the base of the antenna (the aluminum sleeve that contains the connector at the base) to the brick wall and a second ground to the grounding lug on the inline gas discharge unit?

Thanks for the help on this. I want to get this right!

As I stated before, this chapter deals with electrostatics so the time
dependence has been dropped. However, the fact remains that Gauss's
law is the integral form of the first Maxwell equation, which holds
for an arbitrary space-time point. Unless you reject the first
equation, namely

div E(x,t) = 4 \pi \rho(x,t)

or the divergence thereom, you have to accept the fact that

\integral_S E(x,t).dA = 4 \pi \integral_V dV \rho(x,t)

which is Gauss's theorem.

This is my last post regarding this subject.

Hi Al,

You've described what SWLers call a "box loop" antenna. Its notable characteristics are deep nulls in the radiation pattern that are 180° apart, and excellent selectivity. The multiturn loop coupled to a loop with much fewer turn(s) of wire provides the high Q. Treat the two loops as a transformer. A one-turn secondary might seem to indicate a very low output impedance but, in theory, the parallel resonant primary winding appears as an infinite impedance. Practically speaking, it will be some high value. However, the feedpoint impedance will be a function of the square of the turns ratio. In this case, 12^2 or 144:1. Not knowing the electrical characteristics of the primary loop, it would be a crapshoot in determining the feedpoint impedance.

There are stand-alone antenna analyzers available for a few hundred dollars US. If you have a general coverage receiver, a noise or antenna bridge may be usable and cost much less. MFJ (http://www.mfjenterprises.com/) is one manufacturer. I have used a MFJ202B noise bridge, and find it useful.

Yes, that's exactly the point I've been trying, apparently unsuccessfully, to make. It is practical to use ferrite sleeves for suppression of current at a single point or a couple of points, as Walt Maxwell pointed out some time ago. Often called the "W2DU balun", it's done by putting a lot of cores -- typical several tens of cores -- over the line. But you wouldn't want to do this at a dozen or two points on guy wires. I personally prefer to use multiple turns on a single core, because ten turns on one core gives the same impedance a single pass through 100 cores. But then I don't run so much power that I need to use RG-8 or larger size cable or go to heroic efforts to insulate the turns on a single core.

The guy wire requirements would be about the same as for a "current balun" (common mode choke) -- somewhere around 500 - 1000 ohms is typically necessary. At that impedance level, it makes no difference whether the impedance is reactive or resistive from the standpoint of effectiveness in choking current or in terms of dB loss. But there can still be enough power dissipated to overheat the cores if they're resistive and the power level is very high. Then you're stuck with using ferrites which are more reactive and less resistive (e.g., Fair-Rite 60 series), but they also give you a lot less impedance per core so you need more cores yet. That makes the ferrite solution even less attractive.

Roy,

I have attempted to model the famous Carolina Windom. It takes some guessing since it contains proprietary (ie secret) components, namely the "balun" and the "isolator". My flat top is at 10m height.

Since they argue that the vertical feedline is an effective radiator, I make the assumption that the balun is a "voltage" balun, and that it is transparent to common mode current, so I have modelled the feedline as a wire attached to (as it happens) the inner end of the short leg of the flat top.

The "isolator" is argued to prevent the current flowing on the line above itself from flowing on the line below itself. It is a naive notion, since there is mutual coupling... but lets guess that it is a bunch of supression sleeves on coax.

At 7.2MHz, the isolator is subject to appreciable current, and it does not effectively force a current minimum until it is well over 1000+j1000. (BTW, about half the power is dissipated in a 1000+j1000 isolator.) 2000 +j2000 is becoming reasonably effective.

I know there is a proposition that chokes such as the W2DU balun need only have choke impedance about 10 times the nominal Zo to be effective. I think that design constraint is effective in limiting the extent to which such a balun unbalances the load by its own shunt impedance dropped accross one load leg for a load~=Zo, but I think the criteria has nothing to do with the choke's influence in forcing a current minimum in the region of itself. It is the difference between a bench test criteria for insertion VSWR, and what is needed when plugged into an NEC model where the intention is to force a current minimum.

Thoughts?

the later chapter i quoted first is not based on electrostatics, and the
formula for gauss's law is always the same. it is not dependent on time in
any form. thank you for not continuing to prolong the misinformation in
this thread.

I have a 4:1 hybrid balun (4:1 voltage balun coupled up with a 1:1
current balun). Now and then I run the full california-kilowatt to it,
I have NEVER seen the thing REAL WARM unless running into a high
standing wave, but NEVER what I would call REAL HOT.

500+ watts would shortly make it so hot it would burn fingers and smoke
even the high temp thermaleze enamel off the windings (if the balun was
forced to dissipate that power!)

I don't see where half the power could have ever been "sunk" into the
balun, no matter what freq it has been operated at, 2-30. The windings
all look in excellent shape and the core in good condition ...

Or, perhaps I misunderstood your previous post.

Perhaps.

I don't understand the term "California Kilowatt".

I don't know if you are describing the same thing I modelled, I don't
think so.

It is often overlooked that the power of an SSB telephony signal averaged
over a longish time (but not accounting for the duty cycle of "overs") is
around 15dB (a little less for speech processing), so the heating effect
of 500W PEP telephony might be more like 15W.

Duh, guess who left a minus sign out, should read:

It is often overlooked that the power of an SSB telephony signal
averaged over a longish time (but not accounting for the duty cycle of
"overs") is around -15dB (a little less for speech processing), so the
heating effect of 500W PEP telephony might be more like 15W.

I believe that rule of thumb applies only to matched lines,
i.e. Z0 loads. The other rule of thumb that I have heard
is 5x the antenna feedpoint impedance.

Ah Rules of Thumb (ROT) abound.

The first ROT relates to what is happening inside the coax at the choke location (or is it somewhere else), and the choke is on the outside of the coax.

The second ROT relates to the antenna impedance, wherever that is (perhaps it assumed feedpoint adjacent to the choke), and again relates to the differential mode Z (or some transformation) whereas the choke acts on common mode current.

Take for example the use of a common mode choke at the junction between open wire line and coax in a G5RV, its behaviour seems to me to be quite unrelated to the differential mode Z at that point, or at the dipole centre, or anywhere else.

Hmmm, I just may pull that balun down and run a full KW into it hooked to a dummy load to look at some temp readings over a range of bands/over a time span ... maybe the thing has been dumping more heat than I am aware of, time anyway to check out the system ...

The second ROT is of course for cases where the choke is
installed at the antenna feedpoint. The main function of
such a choke is to choke off *conducted* common-mode current.
The effect of the choke on inducted common-mode current is
usually unknown unless measured.

> Take for example the use of a common mode choke at the junction between

> centre, or anywhere else.

Again, the G5RV choke is trying to prevent *conducted* common-
mode currents and only has a chance of success on certain
bands where the differential impedance is relatively low at
the junction point. The effect of the choke on inducted common-
mode current is hard to quantify without measurements.

Source record: 44783

Here are some characteristics of off-center fed dipoles which I've observed in doing careful measurements:

1. The feepoint balun is commonly a voltage balun, which may have the nominal claimed impedance transformation ratio over most of the HF range when terminated with 50 + j0 ohms times the tranformation ratio. However, the antenna doesn't have this impedance at hardly any frequency, and can be very different at some frequencies. When presented with load impedances typical of the antenna, the transformation ratio is way off and becomes complex, and the balun adds considerable shunt and series reactance.

2. Whenever a voltage balun is used to feed an asymmetrical antenna, it creates an imbalance current in its attempt to equalize the voltages at the two halves relative to the "cold" side of the input. This imbalance current flows down the feedline as a common mode current.

3. Additional common mode current results from the unequal mutual coupling between the feedline and unequal antenna halves.

4. It takes very concentrated efforts to reduce the common mode current to a low level on all bands. Multiple current baluns (probably what the CW calls and "isolator") are required, and even then it might also require feedline length adjustments to get low common mode current on all bands.

5. Without being able to quantify what the feedpoint balun will do in terms of transformation, reactance, and common mode current generation, it's impossible to build a model of one of these antennas with any confidence, even if the feedline is included in the model. The best efforts I made to measure a real antenna and its balun and build a model based on the measurements led to generally poor agreement between the measured and model impedance. Consequently I'm extremely skeptical of any model that purports to predict anything about OCF dipole performance.

Walt I have seen some of your work in the handbooks and it makes for good reading. I do use a current balun on a triband beam I have up.

I just have not seen any beads used on guy wires and did not know if it had been tried. I agree it probably would be beter to just use the insulators on the guy wires, but not sure how the price of them and the clamps would compair to the beads. With the guy wires already in place it may just be easier to place some clamp on beads on the guy wires if it would work.

Hi Arie,

As always, Art has a choice of what to discuss, and it is rarely
technical.

>Art could send me his *.ant model file

The world waits in wonder.

Hi Art,

You asked for:
1. Modeling help;
2. Foreign (unamerican) aid;
3. A friendly response;
4. More optimization.

WWAD? (what would Art do?)

Hi Arie,

If you don't confirm his design is the best, then the mist you feel on
your face will not be the fresh Spring dew of early morning. Art may
have to appeal to extra-terrestrials for proof.

Apparently no one on this thread has read my Chapter 21A from my web page at www.w2du.com, where I showed that placing one #43 bead at every 1/4 wl along a feed line eliminated the current flowing on it while immersed in an EM field in the 130 to 150 MHz frequency range. It was the success of this one bead approach during radiation-pattern measurements of spacecraft antennas that led to the development of the W2DU balun with several beads at one location.

I have become the new owner of a KT-34XA which has never been deployed.

Original owner bought it 3 years ago, and it has lay on the floor of his car port ever since. So it has been subjected to rain, bird poo and mice. The main elements (mainly the boom) show the signs weathering. Very dull gray and an almost dusty texture.

What would be the best thing to use to clean the elements, before grease and assembly?

I will make one last effort to to set the record straight. In volume
II of the Feynman Lectures on Physics, the title of chapter 15,
section 6 is "What is true for statics is false for dynamics". The
5th paragraph of that section states "Gauss' law, [eq omitted]
remains...". Also in that section, he has a table (Table 15-1) that
contains two columns:

FALSE IN GENERAL | TRUE ALWAYS
(true only for statics) |

Coulomb's Law | Gauss' law
[...] | [...]

Then in chapter 18, section 1 paragraph 3 you will find the statement:

"In dynamic as well as static fields, Gauss' law is always valid".

I do not think I can make it any more clear than this.

> thank you for not continuing to prolong the misinformation in this
> thread.

Do you also accuse Feynman of spreading misinformation? Unfortunately
he died a few years ago.

Hi Walt,

A prophet is not recognized in his own country. If Art could write as
clearly as you (and to some practical purpose) perhaps his cries would
have merit.

However, as to the content of your Chapter 21A. It seems to me I had
come across this treatment some time ago. It inspired me to use your
W2DU balun specification, and spread the beads along a 20 feet length
of cable for exactly the reasons that initially motivated your first
use of them. If every quarterwave can be snubbed by one bead, then
certainly every 40th of a wave can be snubbed even more by the same
resistance. As I saw it, it was the same investment in beads, and the
same bulk resistance even if Kirchoff would point out that their
spread injected significant wavelength into this to invalidate his
lumped circuit analysis of total resistance. Be that as it may,
conceptually, the shorter element's smaller radiation resistance in
relation to the single bead sees a significantly higher port isolation
through the bead.

As for the practicality of a retro-fit, now that's another question.

At the bottom of that Table is a footnote explaining the bold arrow of your Gauss' law. It reads:
"The equations marked by an arrow (-ï¿½) are Maxwell's equations."

The table equation, and the one you reference in the text are both Maxwell's.

>Then in chapter 18, section 1 paragraph 3 you will find the statement:
>
> "In dynamic as well as static fields, Gauss' law is always valid".

That chapter, too, clearly defines the same equation you are making an appeal to as "Maxwell's equations." Observe Table 18-1 "Classical Physics"

It is explicitly derived from the treatment as equation 4.1 - also denoted Maxwell's equations.

"All charges are permanently fixed in space, or if they do move, they move as a steady flow in the circuit (so rho and j are constant in time). In these circumstances, all of the terms in the Maxwell equations which are time derivatives of the field are zero."

Equations 4.6 and 4.8, the cross and dot products resolve to zero.

If you crank up the clock, Feynman concludes
"Only when there are sufficiently rapid changes, so that the time derivatives in Maxwell's equations become significant, will E and B depend on each other."

We will, of course, recognize this EB relationship as the field of radiation and further recognize there is no field of radiation without a significant time factor.

The grad operator, an inverted, enbolded del, is discussed by Feynman in Chapter 2-4 is a significant element of these equations. The grad operator obeys the same convention as the derivative notation.

Feynman's instruction clearly shows that Maxwell's treatment (actually Heaviside's work before him) is a generalization of Gauss to include time (sorry Art, he got there two centuries ago) and hence describes Gauss equations as special (zero-time) instances of the generality.

As Reggie might have observed, the distributed resistance would
conform to the analogy of distributed inductance and capacitance whose
total contribution would be an extremely lossy transmission line.

I am trying to find information on build your own tower. As retirement nears I plan on having a lot more time for doing things like this and will have a few acres I can devote to an antenna farm. I wouldnt mind learning to design them from scratch but would prefer a computer program if one is available. I know to some building your own tower may not seem practical but my wife and I inherited a lot of the basic materials when her father passed away. I am especialy interested in building tubular foldover mast 50 to 70 ft tall. It seems like years ago I came across a magazine article on this that also had associated design software. Any help would be greatly appreciated.

Source record: 44800

Hi,

I just noticed that when I disconnect the ground from my 180
meters long beverage antenna signal levels drop a whole lot, but crosstalk
from a local broadcaster that would cover all of the MW band and a lot
both above and below almost completely disappears. I don't remember
reading about anything like this anywhere. What's going on?

The ground is just a iron rod that I drove half a meter into wet ground
about where I connect the antenna to the coaxial. I connect it directly to
the shield of the BNC connector about a meter above ground. Not elegant,
but that shouldn't cause crosstalk, should it?

My receiver is an Icom-R5 handheld scanner, 0.150 to 1300MHz continuous.

Yo XG man!

While most of us sympatize with your condition, but your drivell is getting beyong pathetic, you dumping on America is picture of your messed up judgement and your "evaluation" of people here is just reflection of who is messed up.

If you can't get over losing your colonies, or superiority of colonist inbreds, you are free to go back, Eurabia is waiting for you and will undoubtly recognize your genius (of calling reflector - director, and having patent to prove it) and award you cross of the empire or something.

Just what the heck is your "Gausian" contraption suppose to get me that all other known antennas or my designs don't? Lousy pattern with three lobes over perfect ground and 6 dB F/B at 200 MHz??? Whopeeeee!!!

God bless America, the last bastion of freedom and the greatest country on Earth!
Love it, or leave it!

73, cut the crap and get well!

You could have some rectification and creation of intermods going on at some
bad, corroded junction. Check the connections.

That front end is so broad-banded that there is probably
no corrosion needed to generate intermod. I had an ICOM
2m handheld that was useless in downtown Phoenix while
mobile on a dual band mobile antenna. I suspect a notch
filter would be the way to go to reduce the intermod
while keeping full functionality of the Beverage.

You are probably getting intermod from the local station. Obviously
removing the ground made the antenna perform poorer for the desire as
well as the undesired frequencies. My guess is that there was a
considerable change in impedance of the antenna. Assuminng the radio
was a reasonable match for the antenna with the ground stake connected
the radio may well look like a short tot the antenna now.

Ah, alright. I gotta look into that now that I know what I'm looking for.
I've got some ideas about what the problem could be too. Thanks a bundle! =)

The entire ground rod is covered with rust. I checked that there was a
connection with a multimeter, but it could be that's not enough of a check.

I don't think I could make enough band-stop filters to cover all crosstalk
I'm hearing. I'd fill up the greenhouse, for sure!

The R5 has an attenuation function that sometimes is a bit of help...
Maybe the entire receiver is getting overloaded, causing some sort of
overmodulation? The signals are pretty strong after all...

Thanks for the replies!

From: Owen Duffy <none@no.where>
Message-ID: <Xns98F1435DC9F33nonenowhere@61.9.191.5>
Source record: 44811

I have knocked up a web based calculator to assist in design of simple wire spans given the design wind speed, mass per unit length of the wire, wire diameter and Gross Breaking Strength of the wire.

The draft calculator is at http://www.vk1od.net/rigging/awcc.php .

Constructive comments appreciated.

Owen

Though the 60 bit CDC machines were regarded as the ants pants by engineers and scientists, the IBM 370 machines (and later) using double precision were better. The tricky bit was (IIRC) that the representation of reals on CDC machines used a base of 2 for the exponent, whereas the IBM format used 2^16, and obviously the two macines allocated a different number of bits to the mantissa and exponent. It was hard to state the extent of improvmenet in precision in the IBM format due to the use of the larger number for the exponent base.

On occasions, this gave rise to different results from programs ported from on to other. It might have seemed like splitting hairs, but it showed how close to the wind some of the programs ran in terms of numerical stability.

I recall in the early days of Excel (V2???) when Microsoft first allowed user developed add-ins (DLL only, they hadn't thought of VBA), I wrote a function library for Erlang functions (and some other traffic funcitons). A chap I was doing some work for asked for a spreadsheet to resemble a set of printed Erlang tables, and he went through checking them.

When challenged about small differences, I offered "well see, the engineer who probably developed that set of tables as a major project, probably used a CDC machine with a mere 60 bit real representation (which was thought to be the ducks guts in its heyday), but I have used the Intel 80 bit reals inside the routines, and although Excel only uses 64 bit reals, accumulated rounding errors inside the function library are reduced (Erlang is an iteritive calculation, but can be optimised to reduce effects of rounding and overflow)". He was convinced, but I think somewhat dissapointed to see a low cost desktop computer providing a more accurate solution than the iconic CDC.

Our mobile phones have probably got more powerful processors now than the 386/SX16 that I used to develop that library!

... and many other things exist to frustrate accurate computing. Long,
long ago when translating antenna modeling (written in FORTRAN) that had
given reasonable results on a 60 bit/word CDC computer to an IBM 32 bit/word
computer, I found the code for one antenna type to be unsalvageable. No
matter what was done with concatenating words together, garbage resulted. A
close look found that the algorithms used were much too sensitive to
significant figures.
I experienced another case where supposedly identical IBM computers
produced different results using the same code.
I echo: work reasonable examples by hand and compare their results to
what the computer produces.

Believable engineering programs earn respect just as people do.

Richard is right about that. Please ignore my remarks about quantization
within the waveform itself. The quantization only affects the total
quantity of energy; or the power level if you wish to consider the rate
of energy transfer.

However, that doesn't affect the main point: at normal radio
frequencies, RF energy is composed of unimaginably small packets, in
unimaginably large numbers. This means that quantization effects in
energy or power levels are utterly negligible, and we can always think
of RF energy or power as a continuous stream.

It's rather similar to being aware that electric current is actually made up of individual electrons - it's interesting information, but electronic engineering very rarely needs to acknowledge the existence of individual electrons. Even less does antenna engineering need to acknowledge the existence of individual RF photons.

As I said in the previous posting, the energy of EM photons is proportional to the frequency, so quantization effects only begin to be noticeable at frequencies of hundreds of gigahertz, and still only as a small correction in measurements of the very lowest power levels we can detect.

Richard cited the following as a claimed exception:

>A photon is emitted in the cM band when an electron orbiting a
>Hydrogen atom flips its magnetic pole. This event is vastly below the
>short wavelengths you describe by a million-fold. A good number of
>correspondents here are fully capable of detecting this event with
>commercial gear already suitable for the Ham market. They could have
>done it 50 years ago too.
>
That is an example of a quantum effect determining the *frequency* of an RF emission... but the origin of the RF energy doesn't change its character. If a signal generator is tuned to that frequency, it will produce exactly the same kind of RF energy - a torrent of quanta so tiny that their individual existence is irrelevant.

Most handheld receivers are designed to be used with a very short duckie antenna. The front end is totally overwhelmed if connected to an antenna of reasonable size. Besides having a whole lot of extra gain to accommodate the short antenna, compromises have to be made in the front end filtering because of the unit's small physical size. Keeping the power consumption low further limits the dynamic range of the stages.

I have an Icom R1 and it's full of crossmod birdies even with its own antenna. When connected to a real antenna, it's totally unusable, the front end being overloaded and blocked by just about anything. I have to use a 20 or more dB pad if I ever connect it to a decent antenna. I'll bet a substantial attenuation pad would do wonders for yours.

Dear Jimmie (no call sign given):

Even towers as short, and as relatively simple as what you say you are considering, involve safety of life issues! Very expensive computer programs exist that will analyze a tower, however no professional trusts them until comparing what the program exports with what is calculated using a hand-calculator and fundamental concepts.

Textbooks on (mechanical) statics and strength-of-materials would be appropriate places to start. Even a spread sheet can be used to develop computational tools, though a real HP calculator can be a great aid. A good mechanical engineering handbook (Mark's ?) might have the information, but might be more difficult to read. Schaum's Outline series might be better than some textbooks. Of course, you may have this sort of background already.

If you stay below 70 feet and have trees/buildings all around, wind loading calculations are relatively simple. (The standard (222G) on calculating serious wind loads cost about $400.)

Give the group more of an idea of the "boundary conditions" for your proposal. How wonderful to be able to contemplate having time for such a project in retirement.

2456. VSWR doesn't matter?

Newsgroup: rec.radio.amateur.antenna
Date: 2007-03-12 01:08:29 UTC
From: billcalley <billcalley@yahoo.com>
Message-ID: <1173661709.309774.178770@q40g2000cwq.googlegroups.com>
Source record: 44821
Cross-posted to: sci.electronics.design,sci.electronics.basics,rec.radio.amateur.antenna

We are all told that VSWR doesn't matter when using low loss transmission lines, since the RF energy will travel from the transmitter up to the mismatched antenna, where a certain amount of this RF energy will reflect back towards the transmitter; after which the RF will then reflect back up to the antenna -- where the energy is eventually radiated after bouncing back and forth between the transmitter and antenna. I understand the concept, but what I don't quite understand is why the reflected RF energy isn't simply absorbed by the 50 ohm output of the transmitter after the first reflection? For the RF to bounce back and forth, wouldn't the transmitter's impedance have to be very, very high (or low) when the reflected RF energy hit its output stages? I know I'm missing something vital here...

Thanks!

-Bill

That's assuming you use an antenna tuner. The tuner will transform the transmitter's output impedance* just as it transforms the line. Were the transmitter output impedance actually at 50 ohms, on the other side of the tuner it would have the same VSWR as the line when everything was tuned up.

Having said that, the VSWR _does_ matter somewhat when using low loss lines, both because the line loss is low but not zero, and the tuner loss will tend to go up as you correct for higher and higher VSWR.

* I am _not_ going to start the Big Transmitter Output Impedance Debate. sed denizens -- just don't comment on what a transmitter's "actual" output impedance may be, lest you start a flame war.

Hi Ian

Determining the *frequency*? That has to be the most obscure
contribution I've ever seen.

The origin in fact does change its character - that is the whole point
and it is an elemental point of sub-atomic physics at that. Can you
offer a counter-example or any example of Photon generation that
leaves no trace of change? I can offer one that doesn't, I can offer
one that does leave a trace (already done), and examples where the
photon originates from non-electron interaction.

For this last, they too inhabit wavelengths that are orders of
magnitude below the visible. Phononic-Photonic interactions may not
fill library shelves, but their several volumes that do fill at least
one shelf are quite thick. Beyond their contributions we find those
from Excitons, Polarons, Polaritons, Plasmons and so on down the
energy band into the less than milli-eV range. Such photon generation
is in a continuum of wavelengths that challenges the simple Lyman
series of discrete resonances (much less all the other series) you
alluded to previously. That continuum extends over great swaths of
the RF spectrum. To your credit, you allude to this spectrum but
underplay the consequences:
>noticeable at frequencies of hundreds of gigahertz, and still only as a
>small correction in measurements of the very lowest power levels we can
>detect.
The effects are not marginally detectable and are the basis of a new
industry called Nanotechnology.

As for a torrent of quanta so tiny that their individual existence is irrelevant, this distinction could be as easily lost on sunshine, much less HF wavelengths. One can certainly find a power density from an HF antenna that equals that of sunshine. The scale of comparing the number of photons would be the difference between drinking out of a firehose or a tidal wave. Clearly both have long escaped the magnitudes of a gulp and to a drowning man, the comparison would be ironically trivial.

Yep, you are missing the "total destructive interference"
happening toward the source caused by a Z0-match. Here's
an article that might help:

http://www.w5dxp.com/energy.htm

A Z0-match eliminates reflected energy from reaching
the source.

Well, I was never taught that -- which is a good thing because it is
not true.

The most intuitive way to prove this (antenna tuner or not), is to
simply supply more and more power to the load. You will eventually
burn it up.

Now, had the VSWR been better (ie. a better network Return Loss), it
would have taken even more power to achieve the same "charcoal"
results. So VSWR matters.

Antenna will have to be tall enough to clear the current canopy of oaks that cover the property. Materials I have on had are way more heavy duty than what you see towers normaly built of. such as several sections of galvanised sign post The heavy U shaped stuf with the flange, dont know what you call it but there is probably 300 to 400 ft of this stuff, lots of rebar. I could easily build something similar to a Rohn tower with this. Also have a MIG and Stick welder. There is maybe 2000ft of oil well drilling pipe piled up out there. Wife pretty much mandated that I do something with it or get rid of it. She has her ticket too so she is sympathetic to the cause. Ther is also a neighbor who works on heavy equipment and he has a crane. Wonder what a few steaks and beers will get me. First I would like to get up my VHF/UHF stuff. Nothing elaborate here just some stacked Yagi on 2M and 432 and a 5 elemnt Yagi for 6M. The is also a lot of tublar steel some about 6 inches in daimeter. with inch thick walls, I think he was making TVRO mast out of this stuff at one time. Hopefully once I get the place cleaned up I might start a second career, there is a big 30 x 60 ft shop on the property that should be good for something. Oh, yes I do have a 50ft Rohn tower i was thinking about tempoaraly erecting thi as a scafold to work off of. Just a thought.

With the oil well pipe I was planning on making a base from three pieces of it the screw on three pieces and weld bracing on as I go up it then add on three more pieces and keep going up. I figure I should easily build a 65 ft tower this way, maybe more. There are also some really tall southern long leaf pines about 30 years old on the prperty that might be good for something. These are some of the taler trees and I was thinking about stringinging soem 75/80M dipoles of of these.

If I had some design info I might could start figuring out how to make the best use of some of this junk and get a head start on the game.

The active part of the transmitter output isn't 50 ohm.
That would cause half the power to be lost as heat in
the output stage. It's only 50ohm once it becomes a moving
wave in the transmission line.

Hi Bob,

Well, aside from the initial misunderstanding of how power gets to the load (much less back, and then to the load again); I will put to you a question that has NEVER been answered by those who know what the transmitter output Z ISN'T:
"What Z is it?"

An email correspondent suggested that there was no use for such a thing. If your antenna didn't blow down last season, then it wasn't big enough!

Well, you could use the calculator to remove most of the uncertainty and be quite confident it *will* blow down. To do so, use a safety factor well less than 1, say 0.5 should be reliable, and use a low wind speed, so that you don't need to wait long for the event.

>by the 50 ohm output of the transmitter after the first reflection?

Two problems:

1) The transmitter may well have output impedance matching the
characteristic impedance of the transmission line. RF power reflected
back in this case gets converted to heat in the output stage of the
transmitter, in addition to whatever heat the output stage already has to
dissipate.

1a) The reflection may increase requirement of the output
tubes/transistors to both drop voltage and dissipate power. This can be a
problem for many transistors, especially a lot of bipolar ones. It is not
necessarily sufficient to stay within power, current, voltage and thermal
ratings. Many bipolar transistors have reduced capability to safely
dissipate power at voltages that are higher but within their ratings -
sometimes even at voltages as low as 35-50 volts. This problem tends to
be worse with bipolar transistors that are faster and/or better for use
with higher frequencies. The keyphrase here is "forward bias second
breakdown", a problem of uneven current distribution within the die at
higher voltage drop.

2) It appears to me that transmitters can have output stage output
impedance differing from the intended load impedance.
An analog is common practice with audio amplifiers - output impedance is
often ideally as close to zero as possible, as opposed to matching the
load impedance.

If zero output impedance is achieved in an RF output stage, I see a
possible benefit - reflections do not increase output stage heating but
get reflected back towards the antenna. Then again, the impedance of the
input end of the transmission line could be low or significantly reactive
depending on how the load is mismatched and how many wavelengths long the
transmission line is, and that can increase heating of the output stage.
In a few cases transmitted power can also increase.

Not only is increased output stage heating possible and maybe fairly likely, high VSWR also causes a high chance of the output stage seeing a partially reactive load. RF bipolar transistors often do not like those due to increased need to dissipate power with higher voltage drop. As I said above, RF bipolar transistors are likely to really dislike simultaneous higher voltage drop and higher power dissipation.

Sigh

The same misconceptions keep coming up, as they have countless times on this newsgroup and I'm sure they will for decades or perhaps centuries to come. After one of the many previous discussions, I wrote a little tutorial on the topic. Originally in the form of plain text files, I've combined it into a pdf file for easier viewing. You can find it at http://eznec.com/misc/Food_for_thought.pdf.

On page 8 you'll find the statement "THE REVERSE POWER IS NOT DISSIPATED IN OR ABSORBED BY THE SOURCE RESISTANCE". Above it is a chart of several examples which clearly show that there's no relationship between the "reverse power" and the source dissipation. The remainder of the tutorial explains why.

Any theory about "forward" and "reverse" power, what they do, and their interaction with the source, will have to explain the values in the example chart on page 8. Does yours?

Hi Owen,

Classic work includes wind load, ice load, and temperature, with
comined loads usually expressed in pounds per foot lengths. It is a
tedious translation to check your page though. Try researching Pender
and Thomson.

All true.
Also normally, there is a pi type filter (to prevent harmonics), between
amplifier and antenna.
This filter _WILL_ match the antenna to the output impedance of the
transmitter, so _even_ if the transmitter output impedance is very
very low (low voltage high current output stage for example), the reflected
power will be nicely converted to match the transmitter, and heat up the
output amp, with its possible destruction as result.

It really doesn't matter except for overall
efficiency. A 10 ohm source outputting 100 volts
into a local load of R +/- jX sources the same
amount of power as a 100 ohm source outputting
100 volts into the same local load.

Mine does. All of your values can be understood by looking
at the destructive and constructive interference and applying
the irradiance (power density) equations from the field of
optics. You see, optical engineers and physicists don't have
the luxury of measuring voltage and current in their EM waves.
All they can measure is power density and interference and
thus their entire body of knowledge of EM waves rests upon
measurements of those quantities. Those power density and
interference theories and equations are directly applicable
and 100% compatible with RF theories and equations. Any
analysis based on power density and interference will yield
identical results to the ones you reported in your "food for
thought" article which includes the following false statement:

"While the nature of the voltage and current waves when
encountering an impedance discontinuity is well understood,
we're lacking a model of what happens to this "reverse power"
we've calculated."

We are not lacking a model of what happens to this
"reverse power" we've calculated. The model is explained
fully in "Optics", by Hecht. When one has standing waves of
light in free space, it is hard to hide the details under
the transmission line rug.

In general, it is just as easy, and sometimes easier, to deal with the energy values and then calculate voltage and current as it is to start with voltage and current and then calculate the power.

All this is explained in my WorldRadio article at:

http://www.w5dxp.com/energy.htm

The great majority of amateur antenna systems are Z0-matched. For such systems, an energy analysis is definitely easier to perform than a voltage analysis. Here's an example:

```
100W------50 ohm---+---Z0>50 ohms-----load
Pfor1=100W--> Pfor2-->
<--Pref1=0W <--Pref2
```

The power reflection coefficient is 0.5 at point '+'.
The power reflection coefficient is 0.5 at the load.

What are the values of Pfor2 and Pref2? What is the physics equation governing what happens to Pref2 at point '+'?

Some gurus will say that it's the voltage and/or current
that is destroying the final, not the reflected energy.
They have yet to explain how those dangerous voltages
and/or currents can exist without assistance from the
ExH joules/second in the reflected energy wave. Depending
upon phase, the E in the ExH reflected wave is what causes
the overvoltage due to SWR. The H in the ExH reflected
wave is what causes the overcurrent due to SWR.

The impedance seen by the source is

Z = (Vfor+Vref)/(Ifor+Iref)

Where '+' indicates phasor (vector) addition.

The above equation also gives the impedance anywhere
along the transmission line and anywhere along a
standing-wave antenna.

> an exellent treatment on this question has been published in QEX December 94
> under the title "Where does the power go?"

Unfortunately, that article doesn't explain where the
power does go. A much better treatment of the subject
is in "Optics", by Hecht. To understand where the
power does go, one must understand destructive and
constructive interference. Please see my transmission
line example in another posting.

The energy content of a transmission line during
steady-state is always exactly enough to support
the forward traveling wave and the reverse traveling
wave without which there would be no standing wave.

>
> <http://www.dbsinstall.com/whatis/Whatisgood-5.htm>

You're talking about #2 and #3 in the referenced page?

If the panel provides a designated grounding point that's fine.. but that's the "electrical service panel", not just any old panel in the system.. it's the one where the service entrance is, and where the building grounding system is bonded to the earth ground.

Likewise, that picture of the conduit is most likely the service entrance. As the text says, the "conduit running to the service panel" or "between sub panels". The conduit running between the main panel and sub panels is often used as the main grounding conductor, in which case it would be acceptable.

As far as water pipes go.. in many jurisdictions, the water pipe ground isn't allowed any more (because of the prevalence of plastic pipes and various and sundry electrical isolation joints to prevent galvanic corrosion).

One wants to look at the nice disclaimer at the bottom too.. "your local codes may vary" and that's the real kicker.. what the code says is sort of a starting point.. it's your inspector that makes the difference.

>
> Also, why is there a mention for separate grounding of the mast
> and the coax?

In many cases, one can't guarantee that the coax can serve as an appropriate grounding conductor (i.e. it's not big enough, or there are removable connectors, etc.), so in that case, you need a separate grounding conductor. (You'll notice that the code requires that the bonding conductors essentially be permanently attached. hard to do that with removable connectors, like you usually find on coax)

>
> Do I need to provide one ground for the mounting pipe (mast) that
> secures the base of the antenna (the aluminum sleeve that contains the
> connector at the base) to the brick wall and a second ground to the
> grounding lug on the inline gas discharge unit?

Not necessarily. You can daisy chain to a certain extent, but you
should consider the implications for your overvoltage protection. Too
much running hither and yon will increase the inductance of the
grounding line, and depending on what your equipment is grounded to,
that can actually make things worse. (i.e. if your internal equipment is
grounded to the "green wire ground" in the wall receptacle, and the
transient suppressor is grounded to a different wire following a
different path, then you can have pretty big voltages between the two.)

There are audio amplifiers with output impedance around .1 ohm, driving
8 ohm speakers, and having efficiency nowhere near 80/81. The theoretical
limit for efficiency of a class B amp driving a resistive load with a
sinewave is 78.54%.

Of course, that was a tongue-in-cheek posting.
But if you could design a Thevenin equivalent
source with a 0.1 ohm source impedance, wouldn't
the efficiency calculate out to be pretty high?

Hi Art,

Unfortunately John has proven that even (what you assume to be) an MIT Don can get it wrong. He is not (just a software monkey like a lot of us.) His references clearly show in exactly the same areas (chapter and verse) how it is Maxwell's (actually Heavisides') equations that add time to Gauss. In this case Feynman (the winner of the Nobel prize in Physics) clearly states the time relationship introduced by Maxwell two centuries ago.

I am quite sure the very book under your nose says exactly the same thing, using exactly the same equations.

The long and short of it is exactly the same thing you've been told ad infinitum, but have spit on those correspondents. The only thing you've added is shooting sparks (must be related to that spit thing) and pixie sticks.

Haven't you left yet?

Your mistake is that you assume the output of the tx is 50 ohms, in the case
you stated the transmitter must be matched to the impedance it sees looking
into the transmission line.

Hi Jan,

Actually, there is a transformer there in the typical Ham transmitter
(and probably in every general purpose power source) that typically
transforms the native Z to the output Z. This is a step up for solid
state, and step down for tubes. In the solid state rigs, it is a
literal transformer feeding the 1-2 Ohms through a 5:1 winding ratio
to a switched bank of low pass filters. This stuff is mud ordinary.

As for the reflected energy, depending upon the phase it will either
combine destructively (heat) or constructively (cool) in the extremes.
There are, of course, 179 degrees of variation between these extremes
before they repeat themselves again. Cooling, of course, is something
of a misnomer as nothing useful is happening (poor power transfer) so
perhaps the terms should be destructive through uselessly benign.

Interesting.

I understand the reason for quick assembly but I'm curious about the clean-up of the oxidised aluminum elements. What kind of wire brush? Steel? Brass? Why not some sort of abrasive paper? Or a Scotch Brite pad?

I'm also curious why you seem to dismiss the use of conductive anti-sieze compounds - Penetrox, for example.

BTW, I'm not trying to be argumentative, I'm truly curious about your thinking on the matter. Last fall, I put up an aluminum tubing vertical and I'm looking forward to taking it down this spring to see how it fared over the winter. Prior to reassembly I planned on cleaning up the mating connections with aluminum oxide paper and using a light coating (wipe on, wipe off, thin film left behind) of Penetrox.

In my opinion the simplest way to answer your question is that you are assuming that the transmitter is equivalent to a 50 ohm load, which is not true because the transmitter is instead equivalent to the series of a 50 ohm load and a voltage generator.

A simple DC example grossly clarifies thre issue: connect a 12V battery to the series of a 50-ohm load and another 12V battery. How much current flows through the load? Naught (assuming the correct polarity). So no power is dissipated in it.

It matters when it changes suddenly, like mine did recently on my 70MHz
beam, when one of the elements came off in a gale.

As pointed out, VSWR does matter. A lot of bouncing means you heat the transmission line with the power instead of radiating the power. 'Doesn't matter', really means it can be tolerated if need be.

> I understand the concept, but what I don't

> here...

Here is what you are missing. In the case of the output, (real/resistive component of the transmitter), seeing the reflected wave, it is _not_ reflecting that power back up the transmission line as you think it is. It would go back to that real impedance and heat the transmitter. Here is what is done with a miss match in the real world.

trans-output -> match -> line -> antenna

The 'match' is where the magic happens. All the energy coming down the line that got reflected from the antenna 'sees' the 'trans-output -> match' as a perfect reflector and gets bounced back[*]. On the other side of the match is the trans->output. There the trans->output sees a perfect impedance, (technically, the conjugate of the trans->output), so that all the power travels through the match toward the antenna.

The magic is that when the match is tuned, both of the above conditions are satisfied.

*The reflected wave sees a purely reactive reflector not just because of the network but also because of the output power of the transmitter. Without transmitter power the impedance as seen from the load will dramatically change.

Best, Dan.

THAT is true, and it brings us to the point of all this energy
sloshing around until the antenna finally dissipates it out into the
ï¿½ther. It is the reflection off the mismatch of the tuner (the
mismatch seen by the antenna as source to the line going back) that
prevents energy from presenting any destructive results to the source
- the whole point of using a tuner in the first place.

> Richard Clark, KB7QHC

Correct but I just want to remember that the purpose of the tuner is to match the impedance of the transmitter to the impedance of the antenna/ transmission line.The standing waves can be viewed as a reflect voltage, a reflect current or as a reflected impedance. Besides I thought there had been enough quanitative analysis of the question and was hoping a simple answer may be enough to turn on the light bulb for the OP. If he still wanted to know more I figure he would ask.

Hi Hank,

I was speaking more to the idea of cleaning what is ultimately a
cosmetic issue - the rest of the elements. Forget that.

As for your choices in abrasive materials, use what comes to hand. By
this time many would have chimed in with their favorites, and
compounded with lengthy technical reasons. Those reasons are usually
all very well and good in the face of neglecting other simple
considerations which I will expand on.
>
>I'm also curious why you seem to dismiss the use of conductive anti-sieze

This is a kind of belts-and-suspenders solution. There is nothing
wrong with it, but you don't have to go out of your way to use this
stuff if you are mating similar metals.

>BTW, I'm not trying to be argumentative,

What a buzz-kill!

>left behind) of Penetrox.

Let us know how that fared. Myself, I lay down a layer of tape
(Scotch 3M rubber) that extends above and below the joint. I then add
a layer of clay (the black stuff you can buy for more money to pay for
the trademark) typically found either in a flower shop or at the
plumbing shop. I then wrap that with another layer of tape. The two
layers of tap encapsulate the clay for easy, clean removal only.

Joints are always bright and dry when disassembled and we get enough wet here in Rain City to test that claim. My lawn is now buried in 3 inches of moss. I wish I could kill the grass completely.

I don't suppose many would go to this level of waterproofing of yagi elements (I don't have that luxury to consider at the HF end of the scale, and the VHF/UHF never seem to have any problem with connections that are manufactured to be tight). I do this level of waterproofing with every connector or connection, however.

Ok, so it is not for you apparently.

Calculating wind loading of cylindrical wire is problem enough, ice loading might be cylindrical in laboratory tests, but is isn't reliably so in real life. The surface isn't necessarily smooth either (so the assumptions about laminar flow vs turbulent flow are affected). There has been much written on the effects of ice on HV power lines, where they can develop shapes that give them lift, with serious consequences when adjacent lines fly into each other. (Differently to antenna wire spans where wind load dominates the tension, large HV power conductors are so strong and heavy for their diameter, that high winds only marginaly increase tension, ice loaded spans are more affected.)

However, if you want to model ice loading, just increase the weight per unit length of your wire for your chosen ice scenario, and increase the windage diameter, change the GBS if necessary for the lower temperature and run the numbers. I wouldn't propose an example, as I think the results are unreliable.

The calculator probably has its greatest value as a learning tool in individuals exploring scenarios for themselves, they might come to the view that 160m dipole spans made from #16 magnet winding wire are not practical in high winds.

Its not that we design to fail, its that we often fail to design.

Owen

PS: the calculator is metric units only to avoid the complication of comprehensively dealing with imperial units, eg dimensions in decimal inches, fractions, wire diameter in several gauge systems, lbs/mile etc, force in pounds, slugs etc.

Of course. Mine was just a DC example to illustrate things in a simple manner.

When the transmitter is properly tuned, the phase relationship is such that the reflected wave does not get dissipated at all into the 50 ohm output of the transmitter, and is then reflected back to the antenna

In the legacy Reg Edwards left is a program that will tell you what to expect from square loops. If you analyze a square loop with the same loop area as your (presumably round) loop, you should be close. The loop alone will look like a low resistance in series with the inductive reactance of the loop; resonated with a capacitor, the impedance will be much higher. The low resistance will most likely be strongly dominated by the resistance of the wire from which the loop is made.

Cheers,
Tom

Recall -- Firm Press Release

FDA posts press releases and other notices of recalls and market withdrawals from the firms involved as a service to consumers, the media, and other interested parties. FDA does not endorse either the product or the company. This listserv covers mainly Class I (life-threatening) recalls. A complete listing of recalls can be found in the FDA Enforcement Report at: http://www.fda.gov/opacom/Enforce.html

Safeway Recalls Bread in Parts of California and Nevada
Contact:
Teena Massingill, 925-467-3810
Espe Greenwood, 925-467-2212

FOR IMMEDIATE RELEASE -- Pleasanton, Calif., - March 9, 2007 - Safeway Inc. today announced it is voluntarily recalling several of its private label bread products sold at Safeway and Pak 'n Save stores in Northern California and Northwest Nevada. The products may contain wire fragments from production machinery. The recall does not affect products sold at the Company's Vons or Pavilions stores.

The recall affects the following products with "Best Before" dates up to and including March 17, 2007. (Example: Mar 17)

Product
UPC Code #

Pak 'n Save Wheat Bread
113827210002

Safeway Butter Top Wheat Bread
21130-18089

Safeway Butter Top White Bread
21130-18088

Safeway Crushed Wheat Bread
21130-18133

Safeway Super Kids Bread
21130-18336

Safeway Whole Grain Bread
21130-18147

Safeway Premium White Bread
21130-18325

Safeway Premium Wheat Bread
21130-18225

Safeway Oven Joy White Bread
007989305190

Safeway Oven Joy Wheat Bread
007989305191

Safeway Texas Toast Bread
21130-18198

The recall also affects the following products with "Best Before" dates up to and including March 15, 2007. (Example: Mar 15)

Product
UPC Code#

Pak 'n Save White Bread
003827210001

Safeway Premium White Sandwich Bread
21130-18330

Safeway Pan Blanco Bread
007989305010

Safeway French Toasting Bread
21130-18199

Safeway 100% Wheat Bread
21130-18207

The "Best Before" date can be found on the plastic closure. The UPC number can be found on the bottom panel of bread bag. Customers who purchased these products in Northern California or Northwest Nevada can return the bread to their local store for a full refund.

While Safeway has received customer complaints, no injuries have been reported. The production machinery in question has been repaired and the production line cleaned. Safeway values its customers and apologizes for any inconvenience this may have caused.

Source record: 44871

An 868MHz project I am involved with uses a Xemics 1205 Tranceiver taken from a reference design. The output of which is fed to a PCB mounted SMA connector at the end of about 1.5" of PCB trace. The trace was calculated to be 50Ohms but not measured although a transmission test from the point of the reference design and the SMA connector shows a 2db drop.

Unfortunately the whole thing is placed in a metal box with the Antenna passing through the box onto the board. The aerial manufacturer has told us that most energy is emmitted in the box and I guess we also loose receiver sensitivity. Performance wise we set the transmitter to transmit at 15db and get a an ERP of .2mw remote devices with a PCB aerial in plastic cases have an ERP of

We decided to change the SMA connector to a bulk head mounted sma connector, However the range now goes down from a reasonably respectable indoor range of 25m+ (can't get further without passing through a metal wall) to a less inspiring 4 feet. It appear that adding 2-3" of coax with the SMA on the end is enough to do this. We have managed to get about 20Feet if we use a Yagi aerial.

The Xemics part is a direct conversion device and produces IQ signals to monitor. With the extra cable the signals look good with full amplitude at 2 feet but at 4 feet either the I or Q signal vanish but strangely not both as I believe the same input signal is mixed with the local oscillator and a 90 degree phase shifted on to produce the IQ signals.

Could the affects I'm seeing be a reflection of the local oscillator off a poorly matched PCB trace or is there some other strange things I should be looking for, apart from a good RF engineer to work it out for me.

Many thanks for any help or pointers

Paul

No, it's the simplest. A couple of days ago, I quoted and explained the
most basic equation of quantum mechanics:

E = hf

It means that whenever there is a transition between two energy levels,
a photon is emitted whose frequency is uniquely determined by the
difference between those energy levels.

The case you quoted was the so-called "hydrogen line". A hydrogen atom
can have the spin of its single electron aligned in the same direction
as that of its single proton; or in the opposite direction. The former
state has slightly more energy, and when the spin of one atom flips to
the lower-energy state, one quantum of EM radiation is emitted. The
frequency of that radiation is determined by the difference in energy
levels between the two states, and is 1.42GHz.

The hydrogen line is like any other spectral line, except that the
difference in energy levels is unusually small (optical spectroscopists
would call it "hyperfine splitting") so the energy comes out as
microwaves rather than light.

The point I was making was that 1.42GHz radiation generated in this particular manner has no special properties other than its frequency. It is exactly the same kind of RF energy as you'd get from a signal generator tuned to the same frequency.

To the conclusion that a photon is a photon.

All photons propagate the same way.

Electromagnetic radiation is electromagnetic radiation.

All electromagnetic radiation propagates the same way.

The interaction of electromagnetic radiation and matter is a function
of the photon energy, which is a function of the photon frequency.

There is no hard and fast dividing line between antennas and optics.

And probably a few more if I thought about it for a while.

Hi Ian,

So, the photon thus emitted is indistinguishable from any signal
generator's output. Neither of us is surprised, granted.

What distinction are you trying to make that is not already obvious?
>>If a signal generator is tuned to that frequency, it will
>>produce exactly the same kind of RF energy - a torrent of quanta so tiny
>>that their individual existence is irrelevant.
This is nothing more than a tautology. No one is going to be
surprised by this event either.

Can you give us an example of "special properties" that differentiates
a photon from an EM wave? On the face of it, that question is absurd,
but I see nothing distinctive about your comments except in this fine
parsing of "special properties" that seem to vanish (no pun) for
longer wavelengths.

>It means that whenever there is a transition between two energy levels,
>a photon is emitted whose frequency is uniquely determined by the
>difference between those energy levels.

If this is the "special property" and hyperfine are not, then I
suppose it could as easily be called "very special property" to no
less acclaim. The production of photons through a myriad of other
interactions that I offered rather makes this "special property"
rather banal, because those interactions also present harmonic
relationships and are not uniquely determined by transitions - and yet
they remain photons none the less. Would I be overstepping to call
them "extraordinary properties?"

I must presume this casts back to your comment:
>>Quantum
>>theory was developed to explain observations like some kinds of light
>>being emitted in a series of sharp spectral lines, which cannot be
>>explained by a wave-only theory. Instead, it has to be thought of as
>>being built up of individual photons/quanta which can only have certain
>>"allowed" energy levels.
My presumption is that "special properties" and "some kinds of light"

are congruent. Again, it appears to be as tautological as might my examples of "extraordinary properties."

Where does this lead us?

Saying that SWR doesnt matter is a rather broad statement(like saying never or always) but I have know of antenna systems having an SWR of 30:1 and his was normal. The feedline was balanced line made of 1 inch copper. Of course an SWR lie this on coax could be fatal to coax and equipment. A more common example of this is the 1/4 wl matching section on a J-pole antenna. It matches 50 ohms to a few Kohms so an SWR of 60: 1 or so would not be unusal here.S oas long as the feedline can handle the current and voltage peaks without much los it doesnt matter much as long as the source impedance is matched to the impedance at the input to the transmission line.Im sure there is a practical limit though.

Jimmie;

If you are planning to use any of the materials you list here I wouldn't
want to be in the same county. All of the items you list are of low
tensile strength. The well casing will fold over when you try to crank
it up. I know from actual testing. My ELMER had a hundred feet of 6 inch
pipe. We put his tribander on the top end and hooked a wench to the
bottom. After one hell of a lot of cranking we turned around to see how
much more we had to go to put straight up. The tribander was still on
the ground and the bottom of the tower was vertical. The pipe had folded
at the hinge point.
Rebar is good for concrete and stakes but not much else. Fence posts are

extremely bendable.

For your safety forget about your scrap steel and buy a commercial manufactured tower.

If you want a quick lesson in high vswr find a ham with an old tube
transmitter and see if he will hook it up to a mismatched load. The
cherry red plates are the reflected energy being absorbed. Transistors
will just turn to smoke under the same conditions.

Hi david

Wouldnt it be OK to have a high VSWR along the transmission line if the
"tank ckt" can be adjusted to match the load to the transmitter output

impedance? That is, the VSWR along the transmission could concievely be high, yet, with proper "tank ckt" adjustment that impedance seen by the output circuit (plate) wouldnt result in a "cherry red plate".
What I am asking is ? is the transmission line VSWR directly related to "plate reddening"?
I'm more asking than *telling*.

Unfortunately, you'd be learning the wrong lesson.

The cherry color is due to the transmitter being loaded with an impedance it's not designed for, causing the final to run at low efficiency. You can disconnect the antenna and replace it with a lumped RC or RL impedance of the same value and get exactly the same result. Alternatively, you can attach any combination of load and transmission line which give the same impedance, resulting in a wide variation of "reflected energy", and get exactly the same result. All that counts is the impedance seen by the transmitter, not the VSWR on the line or the "reflected power".

The problem is that the idea of "reflected energy" turning the plates hot is so easy to understand, that people aren't willing to abandon it simply because it isn't true.

See http://eznec.com/misc/Food_for_thought.pdf for more.

Yes! All that matters to the transmitter is the impedance it sees. It doesn't know or care that you've mathematically separated the delivered power into "forward" and "reverse" components. It doesn't know or care what the SWR is on the transmission line connected to it, or even if a transmission line is connected at all.

> What I am asking is ? is the transmission line VSWR directly related to
> "plate reddening"?

Absolutely not.

> I'm more asking than *telling*.

That's the first step in learning.

It appears that you agree with that part of my post but you are
drawing
an invalid conculsion from it. I never suggested that the passive
matching
network usually found in a transmitter output is unnecessary.

Jerry;

The point I was trying to make is that the reflected current is
disapated as heat in the finals if the transmitter isn't matched to the
load.
In a tube radio the tank circuit is the equivilent of an antenna
match/tuner and converts the 2000 or so ohms at the plate to the 50 ohms
of the transmission line and the unknown ohms of the mis matched antenna.

As Tim Williams alludes, it depends on the transmitter design.
It will often be complex rarther than resistive. Since the active
device changes impedance during a single cycle of the RF
signal it may not even be adequately described by a single
value in ohms for a paticular frequency if you wish to
analyse the case of forward and reflected power.

Consider a class C or class E output stage with an
output transistor that is low impedance during
most of the positive half of a cycle of signal and mostly
somewhere near open circuit for the negative half
of the cycle. It seems to me that the effect of reflected
power is going to be different depending its phase
relative to the forward power.
I think this also applys to a lesser extent to a class
A PA with a nice hi-Q tank circuit.

As usually whan this topic comes up, It don't feel
like we have arrived at a usefull and convincing model
of what happens, possibly because simple
descriptions don't cover everything.

Hi Bob,

No quantifiable answer I see. It's not unexpected, everyone who knows what it isn't has never been able to say what it is. It seems like the stock answer you give the cop who asks if you know the speed limit.
"No. But I wasn't speeding!"

The dependency here started with a conventional Ham transmitter, one so ordinary as to be a commodity. The design is not so exotic as to elude a very simple value - except for those who know it isn't 50 Ohms.

Agreed with all the above, but...

>There is no hard and fast dividing line between antennas and optics.

Certainly no hard and fast line, because the same basic physics applies at all frequencies and wavelengths. But there are HUGE differences in the size and importance of some effects, for RF and for light.

We cannot tell how big those differences are by just talking about them. We need to rub a few numbers together, and then see what comes out.

So the very first step into quantum mechanics is to put some numbers into the E=hf equation. This immediately proves that quantum effects (although still theoretically present) are too small to be of any practical importance in antenna engineering. At that point, any sensible person would realise they had taken a wrong turning, and get straight back on the road.

For antenna engineering, that road is ENTIRELY built on the classical physics of the 18th-19th century. It can be a hard road to travel, but it's a reliably straight one. Any side turnings are NOT going to be short-cuts to a better understanding.

Jim:

Read the Low Voltage Handbook and more of this now makes complete sense.

My plan is to run a #10 insulated copper wire from the main ground location in the electrical room at the end of my building out and up and then horizontally along the outside brick wall at about the height of the mount for my antenna.

From what you are saying, that single #10 lead can be bonded to the short (probably 24" or less) piece of mast pipe that runs between the two 12" wall mounts up to the base of the 40" X 2" wifi antenna AND to the ground lug on the gas discharge that is screwed into the connector at the base of the antenna mount (inline to the coax cable).

Do I have this correct?

Actually, there will be only a very short piece of #10 from the mast to the discharge unit. Does it matter which one I connect to first prior to looping over to the other?

But reflected energy/power does exist.

For an easy example, such reflections are evident in the picture seen on an analog TV receiver when the match between the transmit antenna and the transmission connected to it is bad enough.

In analog TV transmit systems with a typical 500+ foot length transmission line from the tx to the antenna, a 5% reflection from a far-end mismatch can be quite visible, showing as a "ghost" image that is offset from the main image as related to the round-trip propagation time of the transmission line.

Ian,

For the misunderstood and unappreciated "inventor", hope springs eternal.

It's all for the good, however. RRAA would simply fade away without fractals, crossed-fields, RoomCaps, unmodelable structures, traveling waves, one-second long transmission lines, Poynting vectors, etc.

Source record: 44745

I have a situation where I would like to install a vertical wire above a fiberglass pole I have in the center of the yard. However, I must keep the coax off the ground so I can only feed it about 7 feet from the ground so people and the mower can get underneath. (rental property).

I want to setup a 20 or 30 meter vertical and run ground radials from the base of the pole where the wires can be buried. Is it possible to feed the antenna above the ground plane? for example, I have ground radials connected to a seven foot vertical wire, the shield side, and the center side of the coax would continue upwards to the top, or appropriate height on the pole.

Thanks
Buck

Hi Jimmie,
Keep in mind I'm answering in the context of the op's post. And the theoretical SWR on a stub is infinite. The point of the stub at the antenna is to keep the SWR on the transmission line in a reasonable range, to make a match if you will. To put high SWR on the feedline instead of matching at the antenna isn't a great idea in my book.

OTOH.
I finally did some sidebanding a couple of months ago. (First time on HF.) I got my hands on an old swan 500c. After changing the 6je6's and supply caps, I had to find out what it was like to get on the air. I ran outside and hung a wire between the lab and the shop. 40-50 feet. Put a couple of alligator clips on the end of a chunk of rg-58 and into the window. I started looking for the antenna through the trans-match with an antenna bridge. The tuning was very sharp, lots of Q. I don't know if I could have found it without the bridge :) I was willing to tolerate the miss match to get on the air.

Well, it worked out. I made some great QSLs across the mid west and into northern CA. I live in Vernon AZ. I'm pleased this turned out to be as great a radio location as I thought. It shouldn't be long before I get a beam on a tower. By then I'll look to match at the antenna and keep the SWR off the feed line as much as possible.

Best, Dan.

Well, without a line, you don't have a real component to tune into.
Drawing arcs on a smith chart from an open line with capacitors and
coils will only get you to another purely reactive point.

Best, Dan.

The fact that any transmission line and antenna combination can be
replaced with an RLC lumped load at the transmitter output and the
transmitter can't tell the difference is something that a lot of
hams seem to have a problem understanding.

What I've never understood is why so many hams have a problem with
the concept of equivalent circuits only when antennas and transmission
lines are involved.

Al wrote:
"Is there a nominal impedance for a loop antenna?"

Kraus` 3rd edition of "antennas" is a good reference.

From page 207 we see the radiation resistance is proportional to the square of the number of turns.
On page 209 Kraus gives a graph of radiation resistance versus loop size. We know that radiarion resistance is less the smaller the loop area. From the graph, a one-wavelength circumference loop slightly exceeds 100 ohms.

Best regards, Richard Harrison, KB5WZI

Recall -- Firm Press Release

FDA posts press releases and other notices of recalls and market withdrawals from the firms involved as a service to consumers, the media, and other interested parties. FDA does not endorse either the product or the company. This listserv covers mainly Class I (life-threatening) recalls. A complete listing of recalls can be found in the FDA Enforcement Report at: http://www.fda.gov/opacom/Enforce.html

WinCo Foods Recalls Bread in California and Nevada
Contact:
Michael Read
208-762-2011

FOR IMMEDIATE RELEASE -- Boise, Idaho, -- March 9, 2007 -- WinCo Foods announced today that it is voluntarily recalling several bread products packaged under the Cascade Pride label and sold at its WinCo Foods stores in California and Nevada. The Cascade Pride products, manufactured for WinCo Foods by Safeway Inc., may contain wire fragments from production machinery. The recall does not affect WinCo Foods stores in Washington, Oregon, or Idaho.

The recall affects the following products with a "Best Before" date of March 15, 2007.

Product
UPC Code #
Best Before Mar 15

Cascade Pride Crushed Wheat Bread
17072-00003
X

Cascade Pride 100% Wheat Bread
17072-00007
X

Cascade Pride Butter Top White Bread
17072-00008
X

Cascade Pride White 24 oz. Bread
17072-00017
X

Cascade Pride Wheat 24 oz. Bread
17072-00018

X

Cascade Pride Butter Top Wheat Bread
17072-00021
X

Cascade Pride White Sandwich Bread
17072-00022
X

Cascade Pride Wheat Sandwich Bread
17072-00023
X

Cascade Pride Texas Toast
17072-00068
X

Cascade Pride Maple Toast
17072-00069
X

Cascade Pride White 16 oz.
17072-00101
X

Cascade Pride Wheat 16 oz.
17072-00102
X

The "Best Before" date can be found on the bread bag's plastic closure. The UPC number can be found on the bottom panel of the bread bag. Customers who purchased these products may return the products to their local store for a full refund.

While Safeway has received a few complaints about the products, WinCo Foods has not received any complaints to date. No injuries have been reported. Safeway has assured WinCo that the production machinery in question has been repaired and the production line cleaned. WinCo Foods values its customers and regrets the inconvenience or concern that this voluntary recall may cause

Sure yoiu can, that stub is a transmission line. It would matter if it s a
1/4 wl long or 21 1/4 wl long. If it is designed to handle the current and
voltage peaks it can transmit power with low loss when a high VSWR is
present. Its just that most people dont make there feedlines out of inch
copper tubing. Even with 450 ohm ladder line 10:1 VSWR is very acceptable.

It sounds workable but the feed impedance is pretty high.
You might match 20 meter operation with a quarter wave feeder.
You could also mount a 20 meter ground plane at 7 feet off the ground.

I wish I could, The reason the coax con come across is that it goes
directly to the house, the radials would have to be spread out over
the common-area property. I can bury the radials, but not the coax.
The mower folk will run over it without thinking if it is on the
ground, but the radials can be carried out of the way.

2540. Re: Tower design

Newsgroup: rec.radio.amateur.antenna
Date: 2007-03-13 19:06:04 UTC
From: "J. Mc Laughlin" <jcm@power-net.net>
Message-ID: <wLWdnfhTI4WSdWvYnZ2dnUVZ_vamnZ2d@bright.net>
Source record: 44752

Dear Jimmie D.:

You certainly have some useful raw-materials and auxiliary items (crane, welding equipment). However, safety is of first importance.

Welding of the members so as to preserve strength is not simple. Put another way, one could put together and erect a structure that can stand on its own. However, once subjected to wind or other disturbances, it could fall. You are coy about your location, but if you are in a coastal or near-costal area, peak wind loads could be very large. Your soil might require especially crafted foundations.

Other than the references I suggested, I do not know an inexpensive set of design information. Use Google to see what exists. Whatever you find needs to be used with caution. Gaining a fundamental understanding from one or more of the references will put you in shape to know whether what you find on the Internet is believable. Wind pressure formulas that are found on the Internet are often wrong - at least until one knows the assumptions being used. If you need a building permit to erect a tower, you may be required to have a Professional Engineer certify that the tower conforms to reasonable standards of workmanship and the requirements of the 222G standard.

You have the part of the solution that is usually the most expensive. It is desirable to learn the critical, low cost part that allows you (and others) to be reasonably safe. Indeed, with the help of a local P.E., you may be able to clean the property and assist other radio amateurs with simple towers. Be safe.

Art,

You need to learn to read more carefully. My one and only argument with Walt Maxwell was about the fuss between him and Steve Best. My position then, and still today, was that both of these experts were correct in their technical analysis.

Walt chose a novel approach involving "virtual short circuits", and Steve chose a more traditional wave model. The physical, measurable results were identical, and there would have been no way that anyone could test the difference in the two analyses by any sort of measurement.

I believe there were some harsh words in addition to the technical analysis, but I was not part of that. There was also a huge amount of chatter along the lines of 2 + 2 is not equal to 7, from our favorite nit-picker.

I have no idea why you have lumped me into something to do with MIT. I have been there a few times over the years, but I don't think that would have any connection to RRAA.

Richard,

You are undoubtedly correct, but you have also demonstrated what is really the lifeblood of many arguments in RRAA. You have introduced both transient behavior and multi-frequency behavior.

Clearly these are important in the real world. However, the vast majority of models and calculations used as support for RRAA postings are steady-state and monochromatic. Anyone who stayed awake through calculus and differential equations might recall that the equations for steady-state and transient behavior are often quite different.

No one denies the existence of reflections. Some people get confused by the mathematics of power and voltage. But a big argument is about the round-trip travel of energy in the steady-state. Some people seem to believe that energy continues to flow back and forth from one end of a (mismatched) transmission line to the other under steady-state conditions, even simultaneously traveling in both directions. (Passing like ships in the night?) Since energy is a scalar quantity, and any given joule is not distinguishable from another, it is not clear how the proponents keep track of the bookkeeping, but they muddle through somehow.

Hello Buck,

If I Understand you well, one wire (7 feet) runs from the buried radials up to 7 feet high. The coax runs 7 feet above the ground to your shack.

Whether it is possible depends on several things. For the lower bands (where the vertical 7 feet part is short with respect to 0.25 lambda it will work. You need to install a very good common mode (current) balun (several ones) to avoid common mode current into your coaxial cable. You will have a more or less floating ground.

Least common mode problems you will have when the vertical radiator (the part above 7 feet) is about 0.5 lambda. This high impedance will result in low current into your vertical part of you ground system. The disadvantage is that the impedance of the radiator is high, so you will get a very high VSWR inside your cable (losses).

In the case where the radiator is a quarter wave, you will have an easy match, the current in the 7 feet vertical ground wire will radiate also.

You will get problems when your 7 feet ground wire will be in the range of 0.2..0.3 lambda. The impedance seen from the top of the groundwire will be high, hence the voltage at the shield of your cable. Your common mode choke will experience high voltage (with power dissipation as a result).

When your radiator is somewhat longer then 0.5 lambda, the current in the ground will be opposite to the current in the main radiator, resulting in a bad radiation pattern for DX.

Is it possible for you to create some floating ground wires?

If possible, run some more wires from the 7 feet high feedpoint to ground. When you separate them some inches, the inductance of the 7 feet wire will reduce significantly, introducing less common mode voltage on the cable shield. This reduces the "workload" for the common mode choke.

Hope this will help you.

I cut a small trench with a weed eater and put my RG-8 line in that,
held in with some galvanized fence wire cut to about a foot long and
bent into a "U" shape, one "U" every three feet or so. After five years
I have a hard time finding it, let alone cutting it with the lawn mower,
give that a try!

Richard,

The round trip time on the transmission line is 1uS+, and the period of the highest modulating frequency is 0.2uS, so transient performance of the line is very important.

Run the numbers on typical ham SSB telphony where the rtt is more like 0.2uS+ and the period of the highest modulating frequency is 300uS, is it any wonder transient performance isn't critical.

So, if a solution in the steady state solution doesn't degrade the modulation, why complicate matters with pretend partial time domain solutions. It is half baked thinking in both worlds that drives the thinking that reflected power *must* be dissipated in the anode.

There is no doubt that under load end mismatch, there is a reflected wave on the transmission line, and there is no doubt that under some conditions, the anode dissipates more power, and they may be correlated, but the simplistic explanation above that is commonly touted is BS.

I'd have to say that as soon as a circuit contains a radiator or a
transmission line the arm waving begins.

It also isn't true that there is no energy in the reflected wave, that
such beliefs are gobbledegook, and that RF standing wave energy
just sloshes around in a transmission line at less than light speed.
To really understand what is going on, one has to understand
superposition and interference between RF energy waves. You
are on record as not caring to understand reflected energy. Please
don't condemn those of us who are trying to understand.

> transmission line is connected at all.

Think about this - if the transmission line is exactly one-wavelength
long
and lossless, the transmitter sees exactly the same impedance as the
load. At the load, we know reflections occur, but they are same-cycle
reflections so during steady-state with no modulation, exactly the
same
conditions exist at the transmitter as exist at the load if the
transmitter
has the same impedance as the transmission line. So even if we
cannot measure the reflections back into the transmitter, they are
no doubt, there - that is, unless one denies the existence of
reflections
in which case, one needs to explain how standing waves are possible
without reflections in a single-source system.

I do not understand your comment. If you go back and look at my first
post on this subject (Message-ID <slrnev4j3i.cd7.davis@aluche.mit.edu>),
you will see that I equated Gauss's law with the first Maxwell equation.

Gauss's law is commonly stated as:

The electric flux through a closed surface is proportional to the
amount of charge enclosed by the surface.

As I wrote before, this also happens to be the integral form of the
first Maxwell equation:

div E(x,t) = 4\pi\rho(x,t)

While Gauss may have stated this law in terms of static charges, and
it finds most applications in the static case, the law also holds for
the dynamic case. This is why physicists equate Gauss's law with the
integral form of the first Maxwell equation. And as evidence of this
association, you indirectly pointed out in Message-ID
<tma7v2dqk0b3vpt1udkgcv3j3i21lk8ulb@4ax.com> that Feynman equated the
two in the table 15-1 of volume II of his lectures.

Sorry, sir, but quite a few decades of experience in the analog TV broadcast industry show otherwise (not to mention an accurate theoretical analysis of this condition).

For example, a reflection within an analog TV broadcast signal that is delayed by one microsecond from the main image equates to something like a 10% horizontal displacement of that reflected, or "ghost" image from the main image (525/60Hz TV standard).

A ghost television image amounting to 5% of the main image, and offset by 10% of the width of even a fairly small display screen is not difficult to see (or to be objected to) by an "average" observer at an "average" viewing distance from that display screen.

Reflected r-f power may be less of a concern to amateur radio operators than it is to commercial operators, but that doesn't mean that reflected power is non-existent, or even unimportant.

In that case...

Half power is only lost when terminated to a 50-ohm load;
i.e. no standing waves. What happens when there's a
mismatch and reflected energy :)

I'll go stand in a corner...

A mismatch where, between the feedline and the antenna, feedline and source,
source and impedance seen at the input to the feedline.

I know that Roy was heavily involved with TDR at Tektronix years ago. I began working at the RCA Laboratories' antenna lab in 1958. I don't know what Tektronix was doing relative to TDR at that time, but one of my colleagues at the lab was Donald Peterson. Don was then working on TDR, and to our knowledge then, his work on the subject was new. His experiments showed that using TDR we could spot problems in a TV TX transmission line that was causing ghosts. Using Don's technique, he traveled to many TV stations around the country that had ghost problems, and with TDR he was able to determine the precise location of a discontinuity in the transmission line that produced a reflection that caused the ghost.

That was over 40 years ago, but I seem to remember that any discontinuity that resulted in a VSWR greater than 1.005:1 produced a ghost that could not be tolerated in the transmitted picture.

I'm sure this is the magnitude of reflections Richard F. is referring to.

Just a silly question, did you consider the C-pole antenna ?
It could be a solution to you problem as it does NOT need any radials.
It is a much ignored antenna. I made intensive simulations with 4nec2
and the results are very interesting. The only problem is the feed
point on which you need a choking system.

Using the MKSA system, Gauss' law is expressed as div D = rho. Art can
take the time derivative of both sides, if he wants to, in which case he
gets div d(D)/dt = d(rho)/dt. This doesn't mean much except that it's
what you end up with when you take the divergence of both sides of
the Maxwell equation curl H = j + d(D)/dt, and then apply the equation
of continuity where it fits. (You have to pretend the 'd's'
in each equation are the funny little Greek letters that signify
partial differentiation.) Feynman didn't like to use the magnetic field
intensity vector H or the electric flux density vector D
so he used their B and E equivalents in his presentation of Maxwell's
equations in his _Lectures on Physics_. I guess you could start an
argument over whether or not H and D have physical significance, but
don't ask me to join in.
John, I think you might want to re-think your equation div

E(x,t)=4\pi\rho(x,t).

Analog TV transmission is not quite that sensitive to VSWR, fortunately. Matti Siukola of the RCA Broadcast TV antenna group in Gibbsboro, NJ did some experimental work showing that a 1% reflection (1.02 VSWR) or less is unnoticeable to a critical observer, a 3% reflection (1.06 VSWR) is noticeable but tolerable, and a 5% reflection (about 1.1 VSWR) and above is objectionable. These values applied to the r-f spectrum from visual carrier (Fcv) to Fcv +2.5 MHz or so, and for transmission line lengths of 500 feet and more from the tx to the antenna.

These parameters were measured using an r-f pulse at the visual carrier frequency having the transition times and r-f bandwidth corresponding to the maximum bandwidth limits of the TV channel, only.

The more conventional broadband TDRs used a very short pulse with energy from DC to far beyond the limits of the TV channel. It could resolve small discontinuities along the transmission line, but many of them had no affect on the quality of the transmitted television image, as they were not present in the r-f spectrum of the TV signal. And the pulse return of a wideband TDR is extremely high from the TV transmit antenna itself, which is a DC short across the far end of the line.

RF (RCA Broadcast Field Engineer, 1965-1980)

Source record: 44686

Yes, there's no simple correlation between VSWR at a particular frequency and the reflection coefficient seen by a step or pulse type TDR. As Richard pointed out, these TDRs have energy extending from DC (the step type) or some relatively low frequency (pulse type) to extremely high frequencies. The units I was involved in designing had a 3 dB frequency response and step content of up to 60 GHz. The phase has to be quite constant over this entire bandwidth, also, for good step fidelity. This very wide bandwidth is necessary to produce a fast step and step response (on the order of 10 - 15 ps for the units I worked with) in order to resolve anomalies which are physically very close together. It is possible to translate a TDR return into a spectrum of complex reflection coefficients (that is, a plot of reflection coefficient or SWR vs frequency), but this requires a Fourier transform. However, the energy content at any particular frequency is very small, so many repetitions have to be integrated to provide a usable signal/noise ratio. Likewise, a network analyzer can be swept over a very wide frequency range and S11 converted to a TDR waveform by use of an inverse Fourier transform.

Because of the major difference in spectral content and methodology, a lot of care has to be taken in translating what you observe with a TDR system to what happens in a steady-state single frequency situation. For just one example, with a TDR you can easily tell the difference between a transmission line and load, and a lumped RC or RL circuit. You can also easily see the difference if you use a signal generator and make measurements at several different frequencies. Or if you watch the transient behavior as you turn the generator on and off (as in the frequency-limited TDR Richard described). But in a single frequency steady state system, you can't tell any difference whatsoever, provided that you choose the RC or RL to have the same terminal impedance as the original transmission line/load combination. Whatever effects are seen with all the "forward" and "reverse" power and energy bouncing around the line are seen exactly the same with no line at all and just an RC or RL as a load. So any explanation of the effects (such as the red plates of the mismatched transmitter posed earlier) has to be made without resorting to the bouncing energy. Why that seems so difficult for so many to do is a puzzle.

Roy Lewallen, W7EL

I've noticed that, at least in this area, Fox 39 (WQRF) has a ghost of a few
microseconds (I forget what exactly, I've calculated it before). Something
like 500 feet, IIRC.

I have a Wilson crank up mast that I purchased in about 1980. It was
originally a 77 foot tower but a failure early in its life led to
removal of the top section. The failure was due to a torsional load
(48 element collinear on 440mhz) and other antennas. The section that
failed was about 3 inches in diameter. I appears to be pretty much the
same as what US Tower is selling today.

I have performed needed maintenance through the years and even moved
it from Ohio to North Carolina. In Ohio it was installed as a guyed
tower. It is currently installed un guyed with a home brew device that
allows me to lay it over to work on antennas on the ground.

I feel that every aspect of the mechanism is critical. If it was any
heavier the electric boat winch could not handle the extent ion. If I
had much more weight on the top, the lay over wench (and I-Beam) would
be challenged. It is built just loose enough to not hang on retraction
but not rattle excessively in the wind. I don't even want to think
about what would happen if it jammed on retraction!

The galvanizing is worn off the outside but still in good shape on the
inside. I have replaced a couple of the pulleys and one of the cables
along with miscellaneous clips & such.

When you deal with this thing it is better to think in terms of a
sailboat mast rather than a tower. Most loads you apply try to put a
crease in the tubing or load the extent ion cables.

Your suggested project would require more patience that I have. It
only takes a few hours of welding for me to want to do something else!

I would sell the old tubing & buy a new crank up mast.

BTW, I am currently trying to figure out how I can safely plant a 40
foot utility pole that was a gift....

Again Gene, to be able to prove your point, you need to present an
example of a standing wave that exists without a forward traveling
energy wave and a reverse traveling energy wave. You keep implying
that is possible, but have presented no proof.

Water is also a scalar. If you had one gallon per minute flowing into
a barrel and two gallons per minute flowing out of the barrel, would
you argue that there is no water flowing into the barrel and only one
gallon of water flowing out of the barrel? Or would you say the *net*
water flow is one barrel per minute out of the barrel?

And of course, the same thing can happen in a simple system consisting
of
a TV source, a transmission line, and a mismatched load. TV ghosting
can
prove that the reflected traveling waves make multiple round trips to
the load
and back to the source, yet many continue to deny that proof. The best
(copout) argument that I have heard against it is that, "That is not
steady-state",
and therefore doesn't count. :-)

That's simply not true. When the load is connected directly to the source, incident power is often still rejected, it just doesn't have very far to "bounce". And since it is internal to the source, the "bouncing" is difficult if not impossible to quantitize.

If you hang a purly reactive load on a source output, it rejects all the the incident power just like it does at the end of a one-wavelength long transmission line. If we leave the source output terminals open, i.e. an infinite impedance, all of the source power is rejected at the source output terminal, i.e. there is a standing wave on the internal wire (often coax) connected to the source connector.

In the same way that a source doesn't know whether it is connected to a transmission line or a lumped circuit, a purely reactive load doesn't know whether it is connected to a source or to a transmission line. Either way, it does an immediate rejection of incident power. Whether the load is connected to a transmission line or directly to a source, the reflection at the load is a same-cycle reflection. Since it happens at the load with a transmission line, why are you surprised that it happens at the load with a source?

It is not my equation--- it is the first Maxwell equation (expressed
using Gaussian units). I did not make it up, nor did I add the
time-dependence as another poster suggested.

Hi Buck

Are you interested in experimenting? I would have tried something like
this ----

Run the RG-8 from the "building" to the monopole parallel to the ground
and 7 feet above it. Drop it down parallel to the monopole a few inches
from it all the way to the ground. At the ground, connect the coax the
same way a conventional monopole is connected.

Any low loss, high dielectric constant, material in the immediate vicinity of the parallel coax and monopole will help. A coiled coax type "balun" at the antenna end of the horizontal coax will really be needed too.

I have no idea if you want to "play" with antenna ideas. And, I have no certainty that the antenna would work anyway.

Jerry

Different texts have Maxwell's equations in different order. What text did you get this from? Becker has it (in Gaussian CGS units) as div D = 4\pi\rho (where the backslash indicates multiplication, and D and rho have the usual meanings. You can add the 't' if you want to, but it's unnecessary. Also, since you're dealing in 3 dimensions, why not indicate them as in E(x,y,z), or E(x,y,z,t) (if the time means something to you)?

Au contraire, mon frere. You continue to claim that a standing wave MUST
be made up of two traveling waves, but without proof.

My contention is that this distinction is merely a matter of
mathematical preference. When standing waves occur, there is absolutely
no physical difference between the standing wave and its traveling wave
constituents. If you find some physically significant difference due to
considering traveling wave constituents rather than the standing wave,
then you have made a mistake in your calculations.

This is totally irrelevant to the issue at hand. Try to keep on task.

>to you)?

I tend to write equations in LaTeX form as most people I exchange
emails with mathematical equations use that for formatting mathematics.
Here, \pi represents the greek letter pi, and \rho is the greek letter
rho. I used x to represent a spatial 3-vector. I could have written
it as (x,y,z) but I did not think this shorthand would cause any
confusion given the context.

The difference between E and D is not important here. If you use D,
then \rho must be interpreted as the so-called "free" charge density.
However, the fundamental field is E, and if you use it the \rho must
be interpreted as the _full_ charge density. The relationship between
E and D can be very complex and may well depend upon the strength of
the applied field E. For simple materials a linear relationship is
usually assumed, e.g., D = \epsilon E, where \epsilon is the
dielectric constant of the medium. Also even here in this linear
relationship, \epsilon need not be a scalar (a number). It could be a
tensor (a 3x3 matrix), in which case D and E would not have the same
direction.

<snip>

I've been reading the posts on this. One poster said this has been going on for twenty years! (For the other groups, this thread has life on rec.radio.amateur.antenna) It doesn't need to be so.

First, there should be no doubt that reflected power on a transmission line is real. Sure, you can replace the line with a lump but that doesn't clear up the question for others.

For the next two examples, see page 179:
http://cp.literature.agilent.com/litweb/pdf/54753-97015.pdf
All examples assume the same impedance for source and line.

First example, step into an open line with a Thevenin source. The energy is divided between the source and the line. Half the energy is moving down the line and when it returns changes the impedance the source sees to an open circuit. The energy does not flow back into the source, so, where did it go? It is stored in the capacitance of the line.

Second example, step into a shorted line. When the energy returns the source now sees a short. The energy does not flow back into the source, so, where did it go? It is stored in the inductance of the line.

So here are two examples where the energy sent down the line do not return to the source.

Third example. Send a pulse down the line. The Thevenin voltage source will go to short, as it should, when the pulse falls. The pulse is reflected from either an open or a short at the end of the line. All the energy is dissipated in the source impedance when this pulse returns. That is where the energy goes. And it is obviously the _same_ energy created at the source.

Sure, non of the cases above represent steady state AC. But they do show that energy may or may not be returned to the real component of the source.

With the above in mind, it can be shown, (in some part II), that a real accounting of energy from source to load and back is possible. Equivalent circuits are just that, the trading of line for lump. But, and this is really important, the only reason the effective impedance at the input of a 50 ohm line is not 50 ohms is because of reflected energy.

Best, Dan.

That is definitely an idea to consider. I will have about four to six
inches it'll be away from the vertical.

If you're only operating on HF, 100 watts or less, and your feedline runs are of moderate length, or less, you could probabaly get by with the smaller and inexpensive RG-58.... or RG-8X if you're loss conscious. Either way, you could enclose it in cheap PVC, as small in diameter as you can get and still get the coax through it. The electrical gray stuff would not only be less noticable, but is pretty tough. Groundskeeper weedeaters shouldn't bother it if they hit it.

... just a thought.
